Contents

Part One. Differential Invariants of Point and Dual Transformations 1
§ 1. Local metrical study of point transformations 1
§ 2. Some topologico-differential invariants 3
§ 3. Projective construction of the above invariants 5
§ 4. Local metrical study of the dual transformations 7
§ 5. Calculation of the first order differential invariants just considered . 9
§ 6. Some particular transformations. Relations between densities . . . 11
§ 7. The curvature of hypersurfaces and of Pfaffian forms 12
Historical Notes and Bibliography 14

Part Two. Local Properties of Analytic Transformations at their United Points 14
§ 8. Coefficients of dilatation and residues of transformations in the analytic field 14
§ 9. Transfer to the Riemann variety 16
§ 10. Formal changes of coordinates 17
§ 11. Formal reduction to the canonical form for the arithmetically general transformations 19
§ 12. The case of arithmetically special transformations 21
§ 13. Criteria of convergence for the reduction procedure in the general case 22
§ 14. Iteration and permutability of analytic transformations 26
§ 15. On the united points of cyclic transformations 29
§ 16. Arithmetically general transformations not representable linearly . . 31
Historical Notes and Bibliography 34

Part Three. Invariants of Contact and of Osculation. The Concept of Cross-ratio in Differential Geometry 35
§ 17. Projective invariants of two curves having the same osculating spaces at a point 36
§ 18. A notable metric case 38
§ 19. An important extension 39
§ 20. Projective invariants of contact of differential elements of any dimension 41
§ 21. Two applications 43
§ 22. On certain varieties generated by quadrics 44
§ 23. The notion of cross-ratio on certain surfaces 46
§ 24. Applications to various branches of differential geometry. 48
§ 25. Some extensions 50
Historical Notes and Bibliography 52

Part Four. Principal and Projective Curves of a Surface, and Some Applications 53
§ 26. Some results of projective-differential geometry 53
§ 27. The definition and main properties of the principal and projective curves 55
§ 28. Further properties of the above curves. 57
§ 29. The use of the Laplace invariants and of the infinitesimal invariants 59
§ 30. Some classes of surfaces on which the concept of cross-ratio is particularly simple 61

§ 31. Point correspondences which conserve the projective curves 64
§ 32. Point correspondences which preserve the principal lines 66
§ 33. On the plane cone curves of a surface 68
Historical Notes and Bibliography 69

Part Five. Some Differential Properties in the Large of Algebraic Curves, their Intersections, and Self-correspondences 69
§ 34. The residues of correspondences on curves, and a topological invariant of intersection of two curves on a surface which contains two privileged pencils of curves 69
§ 35. A complement of the correspondence principle on algebraic curves. . 73
§ 36. A geometric characterization of Abelian integrals and their residues 76
§ 37. The first applications 79
§ 38. The equation of Jacobi, and some consequences 81
§ 39. The relation of Reiss, and some extensions 83
§ 40. Further algebro-differential properties 86
Historical Notes and Bibliography 88

Part Six. Extensions to Algebraic Varieties 88
§ 41. Generalizations of the equation of Jacobi 89
§ 42. Generalizations of the relation of Reiss 91
§ 43. The residue of an analytic transformation at a simple united point 93
§ 44. Some important particular cases 95
§ 45. Relations between residues at the same point 97
§ 46. The total residues of correspondences of valency zero on algebraic varieties 98
§ 47. The residues at isolated united points with arbitrary multiplicities 100
§ 48. Extensions to algebraic correspondences of arbitrary valency 103
§ 49. Applications to algebraic correspondences of a projective space into itself 105
Historical Notes and Bibliography 107

Part Seven. Veronese Varieties and Modules of Algebraic Forms 108
§ 50. n-regular points of differentiable varieties 108
§ 51. Some special properties of n-regular points of differentiable varieties 110
§ 52. On the freedom of hypersurfaces having assigned multiplicities at a set of points 114
§ 53. On the effective dimension of certain linear systems of hypersurfaces 115
§ 54. Two relations of Lasker concerning modules of hypersurfaces 117
§ 55. Some important criteria for a hypersurface to belong to a given module 119
§ 56. Some properties of the osculating spaces at the points of a Veronese variety $V_d^{(n)}$ 121
§ 57. The ambients of certain subvarieties of $V_d^{(n)}$ 123
§ 58. The isolated multiple intersections of d primals on $V_d^{(n)}$. 125
§ 59. The regular multiple intersections on $V_d^{(n)}$ 126
§ 60. A special property of the space associated with an isolated intersection on $V_d^{(n)}$ in the simple case 128
§ 61. On a theorem of Torelli and some complements 130
Historical Notes and Bibliography 131

Part Eight. Linear Partial Differential Equations 132
§ 62. Preliminary observations. 132
§ 63. The reduction of differential equations to a canonical form 133
§ 64. Remarks on the solution of the differential equations 134
§ 65. The construction of the conditions of integrability. 136

§ 66. The conditions of compatibility for a system of linear partial differential equations in one unknown 137
§ 67. The analytic case where the characteristic hypersurfaces intersect regularly 139
§ 68. An extension to the non-analytic case 142
§ 69. Some remarks on sets of linear partial differential equations in several unknowns 144
§ 70. The solution of a system of homogeneous equations 146
§ 71. The resolving system associated with a general set of m differential equations in m unknowns 149
Historical Notes and Bibliography 151

Part Nine. Projective Differential Geometry of Systems of Linear Partial Differential Equations 152
§ 72. r-osculating spaces to a variety 152
§ 73. Surfaces representing Laplace equations 153
§ 74. The hyperbolic case 153
§ 75. The parabolic case 157
§ 76. Surfaces representing differential equations of arbitrary order . . 158
§ 77. Varieties of arbitrary dimension representing Laplace equations 158
§ 78. Generalized developables 159
§ 79. Varieties of arbitrary order representing differential equations of arbitrary order 160
§ 80. The postulation of varieties by conditions on their r-osculating spaces 162
Historical Notes and Bibliography 163

Part Ten. Correspondences between Topological Varieties 164
§ 81. Products of topological varieties 164
§ 82. Correspondences and relations 165
§ 83. Inverse correspondences 166
§ 84. Homologous correspondences 167
§ 85. Topological invariants of correspondences between topological varieties 168
§ 86. Arithmetic and algebraic invariants 169
§ 87. Geometric invariants 170
§ 88. i-correspondences on topological varieties 171
§ 89. Semiregular correspondences and their products 173
§ 90. Characteristic integers of a semi-regular correspondence 175
§ 91. Involutory elementary s-correspondences. 175
§ 92. Algebraic and skew-algebraic involutory transformations 177
§ 93. An extension of Zeuthen's formula to the topological domain . . . 178
§ 94. One-valued elementary correspondences 180
§ 95. Correspondences represented by differentiable varieties 181
Historical Notes and Bibliography 183
