Preface to the Second Edition XXIII

The Non-Linear Field Theories of Mechanics. By C. Truesdell, Professor of Rational Mechanics, The Johns Hopkins University, Baltimore, Maryland (USA) and W. Noll, Professor of Mathematics, Carnegie Institute of Technology, Pittsburgh, Pennsylvania (USA). (With 28 Figures) 1

A. Introduction 1
1. Purpose of the non-linear theories 1
2. Method and program of the non-linear theories 3
3. Structure theories and continuum theories 5
4. General lines of past research on the field theories of mechanics . . 8
5. The nature of this treatise 11
6. Terminology and general scheme of notation 13
6 A. Appendix. Cylindrical and spherical co-ordinates 19

B. Tensor functions 20

I. Basic concepts 20
7. Definitions 20
8. Invariants and isotropic tensor functions 22
9. Gradients of tensor functions 24

II. Representation theorems 27
10. Representation of invariants of one symmetric tensor 27
11. Representation of simultaneous invariants 29
12. Tensor functions of one variable 32
13. Tensor and vector functions of several variables 34

C. The general theory of material behavior 36
14. Scope and plan of the chapter 36

I. Basic principles 37
15. Bodies and motions 37
16. Forces and Stresses 39
17. Changes of frame. Indifference 41
18. Equivalent processes 43
19. The principle of material frame-indifference 44
19 A. Appendix. History of the principle of material frame-indifference 45
20. The main open problem of the theory of material behavior 47

II. Kinematics 48
21. Deformation 48

Page

22. Localizations. Local configurations. Histories 51
23. Stretch and rotation 52
24. Stretching and spin 53
25. Polynomial expressions for the rates 55

III. The general constitutive equation 56
26. The principle of determinism. The general constitutive equation . . 56
27. Material isomorphisms. Homogeneity 58
28. Simple materials, materials of grade n, dimensional invariance . . 60
29. Reduced constitutive equations 66
30. Internal constraints, incompressibility, inextensibility 69
31. The isotropy group 76
32. Simple fluids 79
33. Simple solids 81
33 bis. Simple subfluids 86
34. Material connections, inhomogeneity, curvilinear aeolotropy, continuous dislocations 88

IV. Special classes of materials 92
35. Materials of the differential type 93
36. Materials of the rate type 95
37. Materials of the integral type 98

V. Fading memory 101
38. The principle of fading memory 101
39. Stress relaxation 106
40. Asymptotic approximations 108
41. Position of the classical theories of viscosity and visco-elasticity . 113

D. Elasticity 117
42. Scope and plan of the chapter 117

I. Elastic materials 119

a) General considerations 119
43. Definition of an elastic material 119
43 A. Appendix. The Piola-Kirchhoff stress tensors 124
44. Formulation of boundary-value problems 125
45. The elasticities of an elastic material 131
46. Stoppeli's theorems of the existence, uniqueness, and analyticity of the solution of a class of traction boundary-value problems . . . 133
47. Isotropic elastic materials, I. General properties 139
48. Isotropic elastic materials, II. The principal stresses and principal forces 142
49. Incompressible isotropic elastic materials 147
50. Elastic fluids and solids. Natural states 148
51. Restrictions upon the response functions, I. Isotropic compressible materials 153
52. Restrictions upon the response functions, II. Compressible materials in general 162
53. Restrictions upon the response functions, III. Incompressible materials 171

b) Exact solutions of special problems of equilibrium 171
54. Homogeneous strain of compressible elastic bodies 171
55. Incompressible elastic materials, I. Homogeneous strain 179
56. Incompressible elastic materials, II. Preliminaries for the non-homogeneous solutions for arbitrary materials 183
57. Incompressible elastic materials, III. The non-homogeneous solutions for arbitrary isotropic materials 186

Page

58. Incompressible elastic materials, IV. Non-homogeneous solutions for bodies with certain kinds of aeolotropy and inhomogeneity 197
59. Semi-inverse methods: Reduction of certain static deformations that depend upon material properties 199
60. Plane problems 204

c) Exact solutions of special problems of motion 208
61. Quasi-equilibrated motions of incompressible bodies 208
62. Radial oscillations of isotropic cylinders and spheres 214

d) Systematic methods of approximation 219
63. Signorini's expansion 219
64. Signorini's theorems of compatibility and uniqueness of the equilibrium solution 223
65. Rivlin and Topakoglu's interpretation 227
66. Second-order effects in compressible isotropic materials 229
67. Second-order effects in incompressible isotropic materials 241
68. Infinitesimal strain superimposed upon a given strain. I. General equations 246
68 bis. Infinitesimal strain superimposed upon a given strain. II. Infinitesimal stability 252
69. Infinitesimal strain superimposed upon a given strain, III. General theory for isotropic materials 260
70. Infinitesimal strain superimposed upon a given strain, IV. Solutions of special problems 263

e) Wave propagation 267
71. General theory of acceleration waves 267
72. Waves of higher order 272
73. General theory of plane infinitesimal progressive waves 273
74. Waves in isotropic compressible materials. I. General properties . . 278
75. Waves in isotropic compressible materials. II. The case of hydrostatic pressure 284
76. Waves in isotropic compressible materials. III. Determination of the stress relation from wave speeds 285
77. Waves in isotropic compressible materials. IV. Second-order effects . 288
78. Waves in incompressible materials 291

II. Hyperelastic materials 294

a) General considerations 294
79. Thermodynamic preliminaries 294
80. Perfect materials 296
81. Thermal equilibrium of simple materials 298
82. Definition of a hyperelastic material 301
82 A. Appendix. History of the theory of hyperelastic materials in finite strain 304
83. Work theorems 304
84. The strain-energy function 307
85. The isotropy group of the strain-energy function. Isotropic hyperelastic materials, hyperelastic fluids and solids 310
85 bis. Hyperelastic subfluids 314
86. Explicit forms of the stress relation for isotropic hyperelastic materials 317

b) General theorems 319
87. Consequences of restrictions upon the strain-energy function . . . 319
88. Betti's theorem. Variational problems 324

Page

89. Stability 328
90. Wave propagation 332

c) Solutions of special problems 336
91. Ericksen's analysis of the deformations possible in every isotropic hyperelastic body 336
92. Special properties of some exact solutions for isotropic materials . 342
93. Second-order effects in isotropic materials 344

d) Special or approximate theories of hyperelasticity 347
94. The nature of special or approximate theories 347
95. The Mooney-Rivlin theory for rubber 349

III. Various generalizations of elasticity and hyperelasticity 355
96. Thermo-elasticity 355
96 bis. Coleman's general thermodynamics of simple materials 363
96 ter. Coleman and Gurtin's general theory of wave propagation in simple materials 382
97. Electromechanical theories 385
98. Polar elastic materials 389

IV. Hypo-elastic materials 401
99. Definition of a hypo-elastic material 401
100. Relation to elasticity 406
101. Work theorems 411
102. Acceleration waves 413
103. Solutions of special problems 415

E. Fluidity 426
104. Scope and plan of the chapter 426

I. Simple fluids 427

a) General classes of flows 427
105. The concept of a simple fluid 427
106. Lineal flows, viscometric flows 429
107. Curvilineal flows 432
108. Steady viscometric flows 435
109. Motions with constant stretch history 438
110. Dynamical preliminaries for the exact solutions of special flow problems 440

b) Special flow problems 441
111. Problems for lineal flows. Simple shearing, channel flow, lineal oscillations 441
112. Helical flows, I. General equations 445
113. Helical flows, II. Special cases: Flows in circular pipes 448
114. Normal-stress end effects 452
115. Steady torsional flows 458
116. Position of the general and Navier-Stokes theories of viscometry . 465
117. Steady flow through tubes 468
118. Steady extension 472
118 bis. Special flow problems for subfluids 473

c) Special simple fluids 475
119. The older theories of non-linear viscosity 475
119 A. Appendix. Truesdell's theory of the "Stokesian" fluid 485
120. Asymptotic approximations, I. Steady viscometric flows 488
121. Asymptotic approximations, II. General flows 490
122. Secondary flows in tubes 497
123. Fluids of second grade 504

Page

II. Other fluids 513
124. Korteweg's theory of capillarity 513
125. Truesdell's theory of the "Maxwellian" fluid 515
126. Anisotropic solids capable of flow 520
127. The anisotropic fluids of Ericksen, I. General theory 523
128. The anisotropic fluids of Ericksen, II. Statics 528
129. The anisotropic fluids of Ericksen, III. Special flows 530
130. Theories of diffusion 537
