Preface — VII

List of Figures — XV

List of Tables — XVII

1 Introduction — 1

- 1.1 An example to start with — 1
- 1.2 Why should we concern ourselves with nonstandard analysis? — 2
- 1.3 The real numbers in conventional analysis courses — 6
 - 1.3.1 Axiomatic introduction — 6
 - 1.3.2 The natural numbers — 7
 - 1.3.3 Naive numbers and theoretical numbers — 8
 - 1.3.4 Construction instead of axiomatics? — 9
 - 1.3.5 Mathematical induction and recursive definitions — 9
 - 1.3.6 Finite sets — 10
 - 1.3.7 The implicitly used set axioms — 11
 - 1.3.8 The question of mathematical rigor — 12

2 Elements of a complementary calculus course — 14

- 2.1 Leibniz as a historical point of reference — 15
- 2.2 A modern translation of Leibniz's ideas — 16
- 2.3 Preliminary remarks on axiomatics — 17
- 2.4 Set theory in analysis — 19
 - 2.4.1 The standard set axioms — 19
 - 2.4.2 The set axioms not used — 22
 - 2.4.3 Cartesian products — 23
 - 2.4.4 Relations and functions — 24
- 2.5 The Archimedean field of real numbers — 24
 - 2.5.1 The field axioms — 25
 - 2.5.2 The order axioms — 25
 - 2.5.3 Embedding the natural numbers — 25
 - 2.5.4 Definitions and proofs in the metalanguage — 26
 - 2.5.5 Again: Mathematical induction and recursive definitions — 27
 - 2.5.6 Again: Finite sets — 30
 - 2.5.7 The Archimedean axiom — 31
 - 2.5.8 Interim conclusion — 31
- 2.6 The nonstandard axioms of analysis — 32
 - 2.6.1 Axiom schema of transfer — 32
 - 2.6.2 Idealization axiom for real numbers — 34

2.6.3	The standard part axiom and the completeness of real numbers —	36
2.7	Concluding remarks on the axiomatics —	38
2.8	External criteria for central concepts of analysis —	40
2.8.1	Convergence of sequences —	41
2.8.2	Continuity at a point —	43
2.8.3	Uniform continuity —	44
2.8.4	Accumulation point of a set —	44
2.8.5	Limits of functions —	45
2.8.6	Differentiability —	46
2.8.7	Integrability —	47
2.9	Some theorems and proofs —	49
2.9.1	Theorems about sequences —	49
2.9.2	Theorems about continuous functions —	49
2.9.3	Theorems of differential calculus —	51
2.9.4	Theorems of integral calculus —	53
2.9.5	Fundamental theorem of calculus —	55
2.10	Nonstandard definitions —	56
2.10.1	Axiom schema of standardization —	56
2.10.2	Implicit definitions via standardization —	58
2.11	Outlook —	60
2.11.1	Formalization and conservativeness —	60
2.11.2	Countable idealization —	61
2.11.3	Parameter-free standardization —	62
3	An overview of nonstandard analysis —	63
3.1	The history of nonstandard analysis —	63
3.2	Omega calculus according to Schmieden and Laugwitz —	66
3.2.1	Definition of omega numbers —	67
3.2.2	Extension of relations and functions —	68
3.2.3	Infinite and infinitesimal omega numbers —	69
3.2.4	Hyperfinite sequences and sums —	70
3.2.5	Central concepts of elementary analysis with omega numbers —	71
3.2.6	Limitations —	72
3.3	The hyperreal numbers —	73
3.3.1	Field extension via ultrafilter —	73
3.3.2	Transfer principle for hyperreal numbers —	74
3.3.3	Field extension via compactness theorem —	75
3.4	Nonstandard analysis in superstructures —	76
3.4.1	Transitively bounded formulas —	77
3.4.2	Superstructures —	77
3.4.3	Elementary embeddings —	78
3.4.4	Nonstandard embeddings —	80

3.4.5	Standard elements and standard sets —	80
3.4.6	Internal elements and internal sets —	81
3.4.7	Hyperinfinite sets —	82
3.4.8	Analysis for internal functions —	83
3.4.9	Implicit definitions via $*$ —	84
3.4.10	Enlargements and saturation —	85
3.4.11	The existence of nonstandard embeddings —	87
3.5	Internal set theory —	87
3.5.1	Extension of the language —	87
3.5.2	Transfer —	89
3.5.3	Idealization —	90
3.5.4	Standardization —	91
3.5.5	Elementary analysis in internal set theory —	92
3.6	Other axiomatic approaches —	93
3.6.1	Bounded set theory —	93
3.6.2	External set theories —	94
3.6.3	Relative set theories —	97
4	On practice and acceptance in teaching —	101
4.1	Textbooks on analysis —	101
4.2	Nonstandard introductions to analysis —	101
4.2.1	Construction with Fréchet filter —	101
4.2.2	Generalized Ω -adjunction —	104
4.2.3	Superreal numbers —	105
4.2.4	Axiomatic introduction of hyperreal numbers —	107
4.2.5	Elementary calculus based on internal set theory —	109
4.2.6	Elementary calculus based on relative set theory —	110
4.2.7	Summary and comparison —	112
4.3	Teaching experience —	113
4.3.1	The cognitive advantage hypothesis —	113
4.3.2	The cognitive existence of infinitesimals —	116
4.3.3	A-track vs. B-track —	118
4.3.4	Is there resistance? —	119
4.4	A survey among analysis teachers —	121
4.4.1	Responses regarding current practice —	121
4.4.2	The assessment of nonstandard analysis (from the teachers' perspective) —	122
4.4.3	The teachers' arguments —	122
4.4.4	Reasons for a negative attitude towards nonstandard analysis in teaching —	122
4.4.5	How difficult is nonstandard analysis? —	124
4.4.6	How relevant is nonstandard analysis? —	126

4.4.7	What are the benefits of nonstandard analysis? —	130
4.4.8	Are there other reasons for a negative attitude? —	132
5	Philosophical questions and mathematical challenges —	133
5.1	From the foundations of mathematics —	133
5.1.1	A look at history —	133
5.1.2	Is there right and wrong mathematics? —	134
5.1.3	Fundamental questions of the philosophy of mathematics —	135
5.1.4	Realism —	136
5.1.5	Constructivism —	139
5.1.6	Formalism —	140
5.1.7	Reverse mathematics and Hilbert's program —	142
5.1.8	Mathematical practice —	145
5.2	Infinity —	146
5.2.1	Potential vs. actual infinity —	146
5.2.2	Arithmetic vs. unarithmic infinity —	147
5.2.3	Challenge: The actual infinite in arithmetic —	151
5.3	The continuum —	152
5.3.1	The essence of the continuum —	152
5.3.2	Continuum vs. set —	153
5.3.3	The Cantor–Dedekind postulate —	153
5.3.4	The Archimedean axiom —	154
5.3.5	Challenge: The non-Archimedean continuum —	155
5.4	Set theory —	156
5.4.1	The relevance of set theory in mathematics —	156
5.4.2	The set universe as a cumulative hierarchy —	157
5.4.3	The constructible hierarchy —	158
5.4.4	Variety of models —	159
5.4.5	Metalanguage and object language —	160
5.4.6	Background set theory and object set theory —	160
5.4.7	The so-called standard models —	161
5.4.8	Nonstandard pictures of set theory —	163
5.4.9	Multiverse theories —	164
5.4.10	The role of the axiom of choice —	165
5.4.11	Challenge: Nonstandard set universes —	167
5.5	The natural numbers —	168
5.5.1	Peano structures —	168
5.5.2	Object numbers and metanumbers —	169
5.5.3	Which are the true natural numbers? —	170
5.5.4	Challenge: Unlimited natural numbers —	171

- 6 From the foundations of mathematics: On the status of nonstandard numbers — 173
 - 6.1 Ontological questions — 173
 - 6.1.1 Are nonstandard numbers contradictory? — 173
 - 6.1.2 Do nonstandard numbers exist? — 175
 - 6.1.3 Summary of the ontological answers — 179
 - 6.2 Epistemological questions — 179
 - 6.2.1 How definite is nonstandard analysis? — 179
 - 6.2.2 How reliable is nonstandard analysis, foundationally speaking? — 184
 - 6.2.3 Summary of the epistemological answers — 184
 - 6.3 Questions on applicability — 184
 - 6.3.1 What can nonstandard numbers mean for the real world? — 185
 - 6.3.2 Is nonstandard analysis applicable to the real world? — 186
 - 6.3.3 An example from probability theory — 188
 - 6.3.4 Summary of the answers on applicability — 190
- 7 Conclusion — 192
 - 7.1 Summary of the results — 192
 - 7.1.1 Nonstandard analysis in higher education — 192
 - 7.1.2 The teachers’ assessment — 192
 - 7.1.3 On the negative attitude towards nonstandard analysis — 192
 - 7.1.4 Critical reflection on the reasons for rejection — 195
 - 7.2 What is the bottom line? — 198
 - 7.2.1 Options for teaching — 198
 - 7.2.2 Closing words — 199

Bibliography — 201

Index — 211
