Hans Dieter Baehr · Karl Stephan

Heat and Mass Transfer

Second, revised Edition

With 327 Figures

Springer

Contents

Nomenclature xvi

1 Introduction. Technical Applications 1

1.1 The different types of heat transfer 1
1.1.1 Heat conduction 2
1.1.2 Steady, one-dimensional conduction of heat 5
1.1.3 Convective heat transfer. Heat transfer coefficient 10
1.1.4 Determining heat transfer coefficients. Dimensionless numbers . . 15
1.1.5 Thermal radiation 25
1.1.6 Radiative exchange 27

1.2 Overall heat transfer 30
1.2.1 The overall heat transfer coefficient 30
1.2.2 Multi-layer walls 32
1.2.3 Overall heat transfer through walls with extended surfaces 33
1.2.4 Heating and cooling of thin walled vessels 37

1.3 Heat exchangers 40
1.3.1 Types of heat exchanger and flow configurations 40
1.3.2 General design equations. Dimensionless groups 44
1.3.3 Countercurrent and cocurrent heat exchangers 49
1.3.4 Crossflow heat exchangers 56
1.3.5 Operating characteristics of further flow configurations. Diagrams 63

1.4 The different types of mass transfer 64
1.4.1 Diffusion 66
1.4.1.1 Composition of mixtures 66
1.4.1.2 Diffusive fluxes 67
1.4.1.3 Fick's law 70
1.4.2 Diffusion through a semipermeable plane. Equimolar diffusion . . 72
1.4.3 Convective mass transfer 76

1.5 Mass transfer theories 80
1.5.1 Film theory 80
1.5.2 Boundary layer theory 84
1.5.3 Penetration and surface renewal theories 86
1.5.4 Application of film theory to evaporative cooling 87

1.6 Overall mass transfer 91
1.7 Mass transfer apparatus 93
1.7.1 Material balances 94
1.7.2 Concentration profiles and heights of mass transfer columns 97
1.8 Exercises 101

2 Heat conduction and mass diffusion 105

2.1 The heat conduction equation 105
2.1.1 Derivation of the differential equation for the temperature field . . 106
2.1.2 The heat conduction equation for bodies with constant material properties 109
2.1.3 Boundary conditions 111
2.1.4 Temperature dependent material properties 114
2.1.5 Similar temperature fields 115
2.2 Steady-state heat conduction 119
2.2.1 Geometric one-dimensional heat conduction with heat sources . . 119
2.2.2 Longitudinal heat conduction in a rod 122
2.2.3 The temperature distribution in fins and pins 127
2.2.4 Fin efficiency 131
2.2.5 Geometric multi-dimensional heat flow 134
2.2.5.1 Superposition of heat sources and heat sinks 135
2.2.5.2 Shape factors 139
2.3 Transient heat conduction 140
2.3.1 Solution methods 141
2.3.2 The Laplace transformation 142
2.3.3 The semi-infinite solid 149
2.3.3.1 Heating and cooling with different boundary conditions . 149
2.3.3.2 Two semi-infinite bodies in contact with each other 154
2.3.3.3 Periodic temperature variations 156
2.3.4 Cooling or heating of simple bodies in one-dimensional heat flow . 159
2.3.4.1 Formulation of the problem 159
2.3.4.2 Separating the variables 161
2.3.4.3 Results for the plate 163
2.3.4.4 Results for the cylinder and the sphere 167
2.3.4.5 Approximation for large times: Restriction to the first term in the series 169
2.3.4.6 A solution for small times 171
2.3.5 Cooling and heating in multi-dimensional heat flow 172
2.3.5.1 Product solutions 172
2.3.5.2 Approximation for small Biot numbers 175
2.3.6 Solidification of geometrically simple bodies 177
2.3.6.1 The solidification of flat layers (Stefan problem) 178
2.3.6.2 The quasi-steady approximation 181
2.3.6.3 Improved approximations 184
2.3.7 Heat sources 185

2.3.7.1 Homogeneous heat sources 186
2.3.7.2 Point and linear heat sources 187

2.4 Numerical solutions to heat conduction problems 192
2.4.1 The simple, explicit difference method for transient heat conduction problems 193
2.4.1.1 The finite difference equation 193
2.4.1.2 The stability condition 195
2.4.1.3 Heat sources 196
2.4.2 Discretisation of the boundary conditions 197
2.4.3 The implicit difference method from J. Crank and P. Nicolson . . 203
2.4.4 Noncartesian coordinates. Temperature dependent material properties 206
2.4.4.1 The discretisation of the self-adjoint differential operator . 207
2.4.4.2 Constant material properties. Cylindrical coordinates . . 208
2.4.4.3 Temperature dependent material properties 209
2.4.5 Transient two- and three-dimensional temperature fields 211
2.4.6 Steady-state temperature fields 214
2.4.6.1 A simple finite difference method for plane, steady-state temperature fields 214
2.4.6.2 Consideration of the boundary conditions 217

2.5 Mass diffusion 222
2.5.1 Remarks on quiescent systems 222
2.5.2 Derivation of the differential equation for the concentration field . 225
2.5.3 Simplifications 230
2.5.4 Boundary conditions 231
2.5.5 Steady-state mass diffusion with catalytic surface reaction 234
2.5.6 Steady-state mass diffusion with homogeneous chemical reaction . 238
2.5.7 Transient mass diffusion 242
2.5.7.1 Transient mass diffusion in a semi-infinite solid 243
2.5.7.2 Transient mass diffusion in bodies of simple geometry with one-dimensional mass flow 244

2.6 Exercises 246

3 Convective heat and mass transfer. Single phase flow 253

3.1 Preliminary remarks: Longitudinal, frictionless flow over a flat plate . . . 253

3.2 The balance equations 258
3.2.1 Reynolds' transport theorem 258
3.2.2 The mass balance 260
3.2.2.1 Pure substances 260
3.2.2.2 Multicomponent mixtures 261
3.2.3 The momentum balance 264
3.2.3.1 The stress tensor 266
3.2.3.2 Cauchy's equation of motion 269
3.2.3.3 The strain tensor 270

3.2.3.4 Constitutive equations for the solution of the momentum equation . . . 272
3.2.3.5 The Navier-Stokes equations . . . 273
3.2.4 The energy balance . . . 274
3.2.4.1 Dissipated energy and entropy . . . 279
3.2.4.2 Constitutive equations for the solution of the energy equation . . . 281
3.2.4.3 Some other formulations of the energy equation . . . 282
3.2.5 Summary . . . 285

3.3 Influence of the Reynolds number on the flow . . . 287

3.4 Simplifications to the Navier-Stokes equations . . . 290
3.4.1 Creeping flows . . . 290
3.4.2 Frictionless flows . . . 291
3.4.3 Boundary layer flows . . . 291

3.5 The boundary layer equations . . . 293
3.5.1 The velocity boundary layer . . . 293
3.5.2 The thermal boundary layer . . . 296
3.5.3 The concentration boundary layer . . . 300
3.5.4 General comments on the solution of boundary layer equations . . 300

3.6 Influence of turbulence on heat and mass transfer . . . 304
3.6.1 Turbulent flows near solid walls . . . 308

3.7 External forced flow . . . 312
3.7.1 Parallel flow along a flat plate . . . 313
3.7.1.1 Laminar boundary layer . . . 313
3.7.1.2 Turbulent flow . . . 325
3.7.2 The cylinder in crossflow . . . 330
3.7.3 Tube bundles in crossflow . . . 334
3.7.4 Some empirical equations for heat and mass transfer in external forced flow . . . 338

3.8 Internal forced flow . . . 341
3.8.1 Laminar flow in circular tubes . . . 341
3.8.1.1 Hydrodynamic, fully developed, laminar flow . . . 342
3.8.1.2 Thermal, fully developed, laminar flow . . . 344
3.8.1.3 Heat transfer coefficients in thermally fully developed, laminar flow . . . 346
3.8.1.4 The thermal entry flow with fully developed velocity profile . . . 349
3.8.1.5 Thermally and hydrodynamically developing flow . . . 354
3.8.2 Turbulent flow in circular tubes . . . 355
3.8.3 Packed beds . . . 357
3.8.4 Fluidised beds . . . 361
3.8.5 Some empirical equations for heat and mass transfer in flow through channels, packed and fluidised beds . . . 370

3.9 Free flow . . . 373

3.9.1 The momentum equation . . . 376
3.9.2 Heat transfer in laminar flow on a vertical wall . . . 379
3.9.3 Some empirical equations for heat transfer in free flow . . . 384
3.9.4 Mass transfer in free flow . . . 386
3.10 Overlapping of free and forced flow . . . 387
3.11 Compressible flows . . . 389
3.11.1 The temperature field in a compressible flow . . . 389
3.11.2 Calculation of heat transfer . . . 396
3.12 Exercises . . . 399

4 Convective heat and mass transfer. Flows with phase change 405

4.1 Heat transfer in condensation . . . 405
4.1.1 The different types of condensation . . . 406
4.1.2 Nusselt's film condensation theory . . . 408
4.1.3 Deviations from Nusselt's film condensation theory . . . 412
4.1.4 Influence of non-condensable gases . . . 416
4.1.5 Film condensation in a turbulent film . . . 422
4.1.6 Condensation of flowing vapours . . . 426
4.1.7 Dropwise condensation . . . 431
4.1.8 Condensation of vapour mixtures . . . 435
4.1.8.1 The temperature at the phase interface . . . 439
4.1.8.2 The material and energy balance for the vapour . . . 443
4.1.8.3 Calculating the size of a condenser . . . 445
4.1.9 Some empirical equations . . . 446
4.2 Heat transfer in boiling . . . 448
4.2.1 The different types of heat transfer . . . 449
4.2.2 The formation of vapour bubbles . . . 453
4.2.3 Bubble frequency and departure diameter . . . 456
4.2.4 Boiling in free flow. The Nukijama curve . . . 460
4.2.5 Stability during boiling in free flow . . . 461
4.2.6 Calculation of heat transfer coefficients for boiling in free flow . . . 465
4.2.7 Some empirical equations for heat transfer during nucleate boiling in free flow . . . 468
4.2.8 Two-phase flow . . . 472
4.2.8.1 The different flow patterns . . . 473
4.2.8.2 Flow maps . . . 475
4.2.8.3 Some basic terms and definitions . . . 476
4.2.8.4 Pressure drop in two-phase flow . . . 479
4.2.8.5 The different heat transfer regions in two-phase flow . . . 487
4.2.8.6 Heat transfer in nucleate boiling and convective evaporation . . . 489
4.2.8.7 Critical boiling states . . . 492
4.2.8.8 Some empirical equations for heat transfer in two-phase flow . . . 495
4.2.9 Heat transfer in boiling mixtures . . . 496

4.3 Exercises 501

5 Thermal radiation 503

5.1 Fundamentals. Physical quantities 503
5.1.1 Thermal radiation 504
5.1.2 Emission of radiation 506
5.1.2.1 Emissive power 506
5.1.2.2 Spectral intensity 507
5.1.2.3 Hemispherical spectral emissive power and total intensity 509
5.1.2.4 Diffuse radiators. Lambert's cosine law 513
5.1.3 Irradiation 514
5.1.4 Absorption of radiation 517
5.1.5 Reflection of radiation 522
5.1.6 Radiation in an enclosure. Kirchhoff's law 524

5.2 Radiation from a black body 527
5.2.1 Definition and realisation of a black body 527
5.2.2 The spectral intensity and the spectral emissive power 528
5.2.3 The emissive power and the emission of radiation in a wavelength interval 532

5.3 Radiation properties of real bodies 537
5.3.1 Emissivities 537
5.3.2 The relationships between emissivity, absorptivity and reflectivity. The grey Lambert radiator 540
5.3.2.1 Conclusions from Kirchhoff's law 540
5.3.2.2 Calculation of absorptivities from emissivities 541
5.3.2.3 The grey Lambert radiator 542
5.3.3 Emissivities of real bodies 544
5.3.3.1 Electrical insulators 545
5.3.3.2 Electrical conductors (metals) 548
5.3.4 Transparent bodies 550

5.4 Solar radiation 555
5.4.1 Extraterrestrial solar radiation 555
5.4.2 The attenuation of solar radiation in the earth's atmosphere . . . 558
5.4.2.1 Spectral transmissivity 558
5.4.2.2 Molecular and aerosol scattering 561
5.4.2.3 Absorption 562
5.4.3 Direct solar radiation on the ground 564
5.4.4 Diffuse solar radiation and global radiation 566
5.4.5 Absorptivities for solar radiation 568

5.5 Radiative exchange 569
5.5.1 View factors 570
5.5.2 Radiative exchange between black bodies 576
5.5.3 Radiative exchange between grey Lambert radiators 579
5.5.3.1 The balance equations according to the net-radiation method 580

5.5.3.2 Radiative exchange between a radiation source, a radiation receiver and a reradiating wall . . . 581
5.5.3.3 Radiative exchange in a hollow enclosure with two zones . 585
5.5.3.4 The equation system for the radiative exchange between any number of zones . . . 587
5.5.4 Protective radiation shields . . . 590
5.6 Gas radiation . . . 594
5.6.1 Absorption coefficient and optical thickness . . . 595
5.6.2 Absorptivity and emissivity . . . 597
5.6.3 Results for the emissivity . . . 600
5.6.4 Emissivities and mean beam lengths of gas spaces . . . 603
5.6.5 Radiative exchange in a gas filled enclosure . . . 607
5.6.5.1 Black, isothermal boundary walls . . . 607
5.6.5.2 Grey isothermal boundary walls . . . 608
5.6.5.3 Calculation of the radiative exchange in complicated cases 611
5.7 Exercises . . . 612

Appendix A: Supplements 617

A.1 Introduction to tensor notation . . . 617
A.2 Relationship between mean and thermodynamic pressure . . . 619
A.3 Navier-Stokes equations for an incompressible fluid of constant viscosity in cartesian coordinates . . . 620
A.4 Navier-Stokes equations for an incompressible fluid of constant viscosity in cylindrical coordinates . . . 621
A.5 Entropy balance for mixtures . . . 622
A.6 Relationship between partial and specific enthalpy . . . 623
A.7 Calculation of the constants a_n of a Graetz-Nusselt problem (3.246) . . . 624

Appendix B: Property data 626

Appendix C: Solutions to the exercises 640
