	Preface	<i>IX</i>
	Foreword by A.Yu. Tsivadze	<i>XI</i>
	Foreword by V.M. Prikhod'ko	<i>XIII</i>
1	Challenges of Technology of Dispersed Composite Materials	1
	References	7
2	Structure Formation in Dispersed Systems and Materials	11
2.1	Types of Contacts between Particles in Dispersed Systems and Materials	11
2.2	Criteria of Formation of Dispersed Structures	14
2.2.1	Characteristic Critical Particle Size	14
2.2.2	Concentration Factor and Strength of Coagulation Structures	18
2.2.3	Time Factor of Strength of Contacts and Dispersed Structures	22
	References	28
3	Dynamics of Dispersed Systems in Processes of Formation of Composite Materials	31
3.1	Dynamic State of Dispersed Systems	31
3.2	Dynamics of Contact Interactions in Dispersed Systems	36
3.2.1	Nonequilibrium as the Most Important Feature of Dynamics of Contact Interactions	36
3.2.2	Dynamics of Contact Interactions in Two-Phase Dispersions Containing a Solid Phase and Liquid Dispersion Phase (S–L Systems)	37
3.2.2.1	Consideration of the Electrostatic Component of Disjoining Pressure and Slipping of the Dispersion Medium	37
3.2.2.2	Consideration of Particle Shape Factor	39
3.2.2.3	Role of Elastic Properties of Particles and Structural–Mechanical Barrier Formed by Adsorption Surfactant Layer	41
3.2.3	Elements of Dynamics of Contact Interactions in Highly Dispersed Powders	43

3.2.4	Dynamics of Contact Interactions in Three-Phase Systems	45
	References	48
4	Rheology, Vibrorheology, and Superfluidity of Structured Dispersed Systems	51
4.1	Rheology and Vibrorheology of Two-Phase Dispersed Systems	51
4.1.1	Fundamentals of Rheology and Vibrorheology of Two-Phase S–L Systems: Pastes and Suspensions	52
4.1.2	Main Methods and Devices for Measurement of Rheological Properties of S–L Systems	53
4.1.3	Dynamic Loading Modes	59
4.1.4	Full Rheological Flow Curve of Dispersed Systems	60
4.1.5	Rheology and Vibrorheology of Structured Mineral Suspensions	63
4.1.6	Surfactants in Dynamic Processes	71
4.1.7	Vibrorheology and Structure Formation in Bitumen–Mineral Compositions	77
4.1.8	Dynamics of Two-Phase Dispersed L–L Systems: Emulsions	84
4.1.9	Flow and Spreading of Two-Phase S–L Systems over Solid Surfaces	89
4.2	Vibrorheology and Plasticity of Powdered Materials	97
	References	103
5	Structure Formation, Rheology, and Vibrorheology of Three-Phase S–L–G Systems	109
5.1	Kinetics Structure Formation Process in Three-Phase Dispersed Systems under Vibration in the Course of Mixing	109
5.2	Structure Formation and Rheology of Three-Phase S–L–G Systems in Compaction Processes	130
	References	136
6	Application of Methods of Physicochemical Dynamics in the Technology of Dispersed Systems and Materials	139
6.1	General Principles	139
6.2	Technologies of Dispersed Systems	141
6.2.1	Pipeline Hydrotransport of High-Concentration Suspensions	141
6.2.1.1	Wasteless Technology of Ore Mining with Filling Excavation Cavities by a Hardening Mixture of Highly Dispersed Dead Rock, Cement, Water, and Surfactant Additives	141
6.2.1.2	Technology of Production and Hydrotransport of High-Concentration Coal-Water Slurries	141
6.2.1.3	Technology of Production of Multicomponent Highly Dispersed Aggregation- and Sedimentation-Resistant Dispersions	145
6.2.1.4	Prevention of Consolidation of Hygroscopic Powdered Materials	147
6.3	Dispersed Composition Materials	149

6.3.1	Dispersed Hydration Hardening Materials	149
6.3.2	Abrasive Materials as an Example of High-Filled Highly Dispersed Composites	153
6.3.3	New Type of Composition Material for Road Construction: Asphalt Concrete with Nanodispersed and Polymer Components	155
6.3.4	Effect of Exposure to Vibration of Crystallization Structure, Filled Polymer Composition, and Fibrous Materials	157
	References	159
	Conclusion	163
	Endorsement	165
	Appendix	167
	Index	175
