Preface — IX

List of abbreviations — XI

Dieter Bauer and Thomas Fennel

I	How to propagate a wavefunction? — 1
1	Time-dependent Schrödinger equation — 2
1.1	Time propagation and stability — 3
1.2	Spatial discretization — 3
1.3	Imaginary-time propagation — 10
1.4	More dimensions: Operator splitting — 13
1.5	Expansion in spherical harmonics — 18
2	Scaled cylindrical coordinates — 36
3	Employing second-quantization notion — 38
3.1	Grid hopping — 40
4	Summary — 43

Dieter Bauer

II	Calculation of typical strong-field observables — 45
1	Ionization rates — 45
2	Photoelectron spectra — 48
2.1	Energy window operator method — 50
2.2	Spectral method — 56
2.3	Time-dependent surface flux method — 64
2.4	Pros and cons of the various methods for photoelectron spectra — 68
3	Emitted radiation and high-harmonics spectra — 69

Heiko Bauke

III	Time-dependent relativistic wave equations: Numerics of the Dirac and the Klein–Gordon equation — 77
1	From nonrelativistic to relativistic quantum mechanics — 77
1.1	Relativistic quantum mechanical equations of motion—a naive attempt — 77
1.2	The Klein–Gordon equation — 79
1.3	The Dirac equation — 82
2	Free particles and wave packets — 85
2.1	Free-particle solution of the Klein–Gordon equation — 85
2.2	Free-particle solution of the Dirac equation — 88

3	Numerical solution of the Dirac equation — 93
3.1	General methods for time-dependent quantum mechanics — 93
3.2	The split operator method — 97
3.3	The Fourier split operator method for the Schrödinger equation — 99
3.4	The Fourier split operator method for the Dirac equation — 101
4	Numerical examples — 104

Dieter Bauer

IV	Time-dependent density functional theory — 111
1	A few general remarks on time-dependent many-particle methods — 112
2	DFT for effective single-electron potentials — 114
2.1	KS spin-DFT — 114
2.2	Actual implementation — 121
3	Time-dependent calculations — 128
3.1	Time-dependent KS solver with spherical harmonics and multipole expansion — 129
3.2	Low-dimensional benchmark studies — 134
3.3	Where TDDFT fails in practice — 140

Chris R. McDonald, Gisela Pöplau, and Thomas Brabec

V	The multiconfiguration time-dependent Hartree–Fock method — 145
1	Multiconfiguration time-dependent Hartree–Fock — 146
2	Implementing the MCTDHF method — 149
2.1	Uniform grids — 149
2.2	Computation of the mean-field operator — 150
2.3	Restricted vs unrestricted — 151
2.4	Time integration — 152
2.5	Computing the ground state — 153
3	Applications of MCTDHF — 153
3.1	Calculation of highly correlated ground states — 153
3.2	Nonsequential double ionization — 155
3.3	High-harmonic generation — 157
4	Extending MCTDHF to nonuniform grids — 158
4.1	Differentiation on a nonuniform grid — 159
4.2	Integration on nonuniform grids — 160
4.3	Treatment of the two-body terms — 162
4.4	Ground state of small sodium clusters — 163
5	Conclusion — 165

Stefan Pabst and Robin Santra

VI	Time-dependent configuration interaction singles — 169
1	Introduction — 169
2	Basics of TDCIS — 171
2.1	TDCIS wavefunction — 171
2.2	The N -body Hamiltonian — 173
2.3	Equations of motion — 175
2.4	Limitations — 176
3	Implementation of TDCIS — 177
3.1	Symmetries and orbital representations — 177
3.2	Evaluating matrix elements — 179
3.3	Spin-orbit interaction — 181
3.4	Grid representation — 183
3.5	Hartree-Fock — 184
3.6	Complex absorbing potential — 186
3.7	Expectation values — 187
3.8	Ion density matrix — 188
4	Strong-field applications of TDCIS — 189
4.1	Subcycle ionization dynamics and coherent hole motion — 189
4.2	Multiorbital and collective excitations in HHG — 195

Dejan B. Milošević

VII	Strong-field approximation and quantum orbits — 203
1	S -matrix elements — 204
2	Strong-field approximation — 206
3	Harmonic generation rate and ionization rate — 208
4	Ground-state wavefunctions, rescattering potential, and multielectron effects — 209
5	Numerical examples for harmonic and electron spectra — 211
6	Saddle-point method — 214
7	Classification of the saddle-point solutions — 216
8	Numerical results for HATI spectra obtained using the SPM and uniform approximation — 218
9	Quantum orbits — 220
10	Summary — 222

Christian Peltz, Charles Varin, Thomas Brabec, and Thomas Fennel

VIII	Microscopic particle-in-cell approach — 227
1	Basic concept — 228
1.1	Physical problem — 228

1.2	Particle representation —	229
1.3	PIC approximation —	230
1.4	MicPIC force decomposition —	230
1.5	The MicPIC approximation —	232
2	Numerical aspects of MicPIC —	233
2.1	Electromagnetic field propagation with the FDTD method —	233
2.2	Particle representation on the PIC level —	244
2.3	Local correction —	247
2.4	Particle propagation —	250
2.5	Implementation of ionization —	252
2.6	MicPIC parameters and scaling —	254
2.7	MicPIC system energy calculation —	256
3	Applications —	256
3.1	Laser excitation of a solid-density foil: A simple MicPIC example —	256
3.2	Time-resolved x-ray imaging —	259
4	Summary —	267
