

Table of Contents

Projects within the Open Hybrid LabFactory	1
Multi material design. A current overview of the used potential in automotive industries	3
<i>Benjamin Bader, Eiko Türk, and Thomas Vietor</i>	
Data mining applications in manufacturing of lightweight structures	15
<i>Sebastian Gellrich, Marc-André Filz, Johannes Wölper, Christoph Herrmann, and Sebastian Thiede</i>	
Development and numerical validation of combined forming processes for production of hybrid parts	29
<i>Bernd-Arno Behrens, Sven Hübner, Alexander Chugreev, André Neumann, Nenad Grbic, Henrik Schulze, Ralf Lorenz, Moritz Micke, and Florian Bohne</i>	
Functional Components	41
Hybrid components with function integration for crash related applications in electromobility	43
<i>Sebastian Iwan, Frank Schettler, Wolfgang Nendel, and Lothar Kroll</i>	
Composite engine block – Challenges for design and material	51
<i>Melanie Jauernick, Dr. Christine Schütz, Joachim Sterz, and Birte Horn</i>	
Development of a light-weight seat structure using a hybrid material approach	61
<i>Claudia Creighton, Mandy de Souza, Russell J. Varley, and John Antony</i>	
Smart Production/Smart Components	69
Smart system integration – Potentials and challenges in the integrated condition monitoring of lightweight structures	71
<i>Michael Heinrich, Ricardo Decker, Marco Walther, and Lothar Kroll</i>	
Potentials of load carrying conductor tracks in new vehicle structures	79
<i>Alexander Pototzky, Daniel Stefaniak, and Christian Hühne</i>	
Numerical and experimental investigation of fiber reinforced biocomposites as structural parts in automotive applications	91
<i>Benedikt Lahl, Nikita Pyatov, Christian Busch, Stefan Hartmann, Hans-Josef Endres, and Tim Andreas Osswald</i>	

Design and Simulation of Hybrid Structures 103

Innovative hybrid material concepts and their virtual safeguarding 105
Henning Gleich, Frank Meißen, Kim Kose, and Christian Paul

Carbon carrier – Integrated concept for innovative interior structures 111
Michael Hage, Benjamin Wagner, and Frank Preller

Tailored stacked hybrids – An optimization-based approach in material design for further improvement in lightweight car body structures 119
Alan A. Camberg, Ina Stratmann, and Thomas Tröster

A manufacture constrained design methodology application for a tailored forming hybrid component 133
Renan S. Siqueira, and Roland Lachmayer

New Production Technologies 145

Material- and process characterization of fibre-metal-elastomer laminate components with high forming degrees 147
Sven Roth, Sven Coutandin, and Jürgen Fleischer

Material Concepts 155

Film-adhesives for polymer-metal hybrid structures – From laboratory to close-to-production 157
Thorsten Schnettker, Philipp Dreessen, Klaus Dröder, Christian Vogler, David Koch, Thomas Frey, Benjamin Poller, Andreas Wedemeier, Christian Vree, Jörg Kosowski, and Daniel Riss

Testing of metal connections using adhesive bonding combined with self-piercing riveting 167
M. Reil, O. Knoll, D. Morin, and M. Langseth

Application of innovative material concepts for safety lightweight inside cars using alternative powertrains 175
Stefan Lindner

Bio-based materials for exterior applications – Project BioHybridCar 189
Ole Hansen, Christoph Habermann, and Hans-Josef Endres

Improving the durability of bio hybrid fiber reinforced plastics by plasma treatment 201
Florian Bittner, Martin Bellmann, Madina Shamsuyeva, Hans-Josef Endres, and Wolfgang Viöl

The best properties from thermoplastic and thermosetting resins combined in fiber reinforced plastics for improved productivity and properties 213
Andreas Niepel, Woo Jin Choi, Thomas Kowalik, and Andreas Hartwig

FAUST: Material characterization of low-cost foam materials under real boundary process conditions for RTM large-scale production 221
Mark Opitz, Dominic Bertling, and Nico Liebers
