Preface — V

1	Overview of signals and systems — 1
1.0	Introduction — 1
1.1	Basic definitions and classification of signals — 2
1.1.1	Concepts — 2
1.1.2	Description of signals — 2
1.1.3	Classification of signals — 2
1.1.4	Representation and plotting of signals with MATLAB — 8
1.2	Basic operations of signals — 9
1.2.1	Operations “+”, “-” and “x” of signals — 9
1.2.2	Signal transformations in the time domain — 9
1.3	Elementary signals — 13
1.3.1	The continuous-time unit step function — 13
1.3.2	The continuous-time unit impulse function — 14
1.3.3	Properties of the CT unit impulse function — 16
1.3.4	The discrete-time unit step and impulse sequences — 19
1.4	Basic definitions and classification of systems — 21
1.4.1	Introduction to systems — 21
1.4.2	Classifications of systems — 22
1.5	Framework of analytical methods — 29
1.5.1	Analytical methods for LTI systems — 29
1.5.2	Key issues to study — 29
1.5.3	Framework of all chapters — 31
1.6	Summary — 32
2	Time-domain analysis of LTIC systems — 37
2.0	Introduction — 37
2.1	Representation of the LTIC system — 38
2.1.1	Analytical description based on mathematical models — 38
2.1.2	Description based on the block diagram — 38
2.2	Classical solution of the differential equation — 40
2.2.1	Classical solution of the direct method — 40
2.2.2	Initial value of the system — 43
2.2.3	Zero-input response and zero-state response — 44
2.2.4	Response calculation with MATLAB — 47
2.3	The impulse response and step response — 48
2.3.1	CT impulse response — 48
2.3.2	CT step response — 49
2.3.3	Solution by MATLAB — 51

2.4	Convolution integral — 52
2.4.1	Signal decomposition in the time domain — 52
2.4.2	Definition of the convolution integral — 53
2.4.3	Graphical method for evaluating the convolution integral — 56
2.4.4	Properties of the convolution integral — 58
2.4.5	Comprehensive application instances — 63
2.4.6	Convolution computation with MATLAB — 67
2.5	Summary — 68
3	Time-domain analysis of LTID systems — 73
3.0	Introduction — 73
3.1	Representation of an LTID system — 74
3.1.1	Analytical description based on mathematical models — 74
3.1.2	Description based on the block diagram — 74
3.1.3	General form of the difference equation — 75
3.2	Classical solution of the difference equation — 76
3.2.1	Classical solution of the direct method — 76
3.2.2	Zero-input response and zero-state response — 79
3.2.3	Response calculation with MATLAB — 83
3.3	Impulse response and step response — 84
3.3.1	Basic discrete-time sequence — 84
3.3.2	Unit impulse response and step response of an LTID system — 87
3.3.3	Calculation with MATLAB — 91
3.4	Convolution sum — 92
3.4.1	Representation of sequences using Dirac delta functions — 92
3.4.2	Convolution sum — 92
3.4.3	Graphical method for evaluating the convolution sum — 95
3.4.4	The carry-less multiplication method — 97
3.4.5	Properties of the convolution sum — 98
3.4.6	Convolution calculation with MATLAB — 100
3.4.7	Application of the convolution sum — 101
3.5	Summary — 103
4	Frequency-domain analysis of LTIC systems — 107
4.0	Introduction — 107
4.1	CTFS of periodic signals — 108
4.1.1	Trigonometric CTFS — 108
4.1.2	Symmetry of waveform and harmonic characteristics — 112
4.1.3	Exponential Fourier series — 112
4.1.4	Parseval's power theorem — 115
4.2	Fourier spectrum of periodic signals — 116
4.2.1	Definition of the Fourier spectrum — 116
4.2.2	Characteristics of the spectrum of periodic signals — 118

4.2.3	Application of the Fourier series —	121
4.3	Continuous-time Fourier transforms —	123
4.3.1	Definition of CTFT —	123
4.3.2	CTFT pairs for elementary CT signals —	124
4.3.3	Properties of CTFT —	126
4.3.4	Fourier transforms of real-valued even and odd functions —	134
4.3.5	Parseval's energy theorem —	135
4.3.6	CTFT of periodic functions —	136
4.4	LTIC systems analysis using CTFT and CTFS —	138
4.4.1	Response of the LTIC system to the complex exponential function —	138
4.4.2	Response of the LTIC system to an arbitrary signal —	139
4.4.3	The Fourier transfer function of an LTIC system —	139
4.4.4	Steps of calculating the response with CTFT —	141
4.4.5	Steps of calculating the response with CTFS —	142
4.4.6	Response computation with MATLAB —	144
4.5	Applications of transmission and filtering —	145
4.5.1	The undistorted transmission system —	145
4.5.2	Frequency characteristics of an ideal low-pass filter —	147
4.5.3	Impulse and step response of an ideal low-pass filter —	147
4.5.4	Conditions of physically realizable systems —	149
4.5.5	Nonideal low-pass filter —	149
4.5.6	Application of the amplitude modulation system —	150
4.6	Sampling theorem —	152
4.6.1	Model of ideal impulse-train sampling —	152
4.6.2	CTFT of the sampled signal —	153
4.6.3	Sampling theorem —	154
4.6.4	Reconstruction of a band-limited signal from its samples —	154
4.6.5	Sampling with MATLAB —	157
4.7	Summary —	158
5	Laplace transform and complex frequency-domain analysis —	163
5.0	Introduction —	163
5.1	Analytical development —	163
5.1.1	From CTFT to the bilateral laplace transform —	163
5.1.2	Region of convergence —	164
5.1.3	Unilateral Laplace transform —	166
5.1.4	Relationship between CTFT and the Laplace transform —	167
5.2	Basic pairs and properties of the Laplace transform —	168
5.2.1	Laplace transform pairs for several elementary CT signals —	168
5.2.2	Properties of the Laplace transform —	169
5.3	Inverse Laplace transformation —	173
5.3.1	Characteristic roots of the Laplace transform —	173

5.3.2	Real-valued and first-order poles —	173
5.3.3	Complex-valued and first-order poles —	174
5.3.4	Real-valued and repeated poles —	176
5.3.5	Calculation with MATLAB —	177
5.4	Application of the Laplace transform in circuit analysis —	177
5.4.1	S-domain models of circuit —	178
5.4.2	Analysis in the S-domain of the circuit system —	180
5.5	Application of solutions of differential equations —	181
5.5.1	Analysis of computing zero-input and zero-state response —	181
5.5.2	Analysis of computing the overall response —	183
5.6	Laplace transfer function —	184
5.6.1	Definition of the Laplace transfer function —	184
5.6.2	Characteristic equation, zeros and poles —	186
5.6.3	Nature of the shape of impulse response for different poles —	186
5.6.4	Stability conditions in the S-plane —	188
5.6.5	Laplace transfer function with the frequency response function —	189
5.6.6	Calculation with MATLAB —	190
5.7	Signal-flow graph and LTIC system simulation —	193
5.7.1	Block diagram representation —	193
5.7.2	Model of basic components of LTIC systems —	194
5.7.3	The signal-flow graph of LTIC systems —	195
5.7.4	Mason's rule —	196
5.7.5	Simulation of the LTIC system —	198
5.8	Summary —	201
6	The Z-transform and Z-domain analysis —	209
6.0	Introduction —	209
6.1	Analytical development —	209
6.1.1	From the Laplace transform to the Z-transform —	209
6.1.2	Region of convergence —	210
6.1.3	Unilateral Z-transform —	213
6.2	Basic pairs and properties of the Z-transform —	213
6.2.1	Z-transform pairs for several elementary DT signals —	213
6.2.2	Properties of the Z-transform —	214
6.3	Inverse Z-transform —	218
6.3.1	Power series method —	218
6.3.2	Characteristic roots of the Z-transform —	220
6.3.3	Real-valued and first-order poles —	221
6.3.4	Complex-valued and first-order poles —	222
6.3.5	Real-valued and repeated poles —	224
6.3.6	Calculation with MATLAB —	226
6.4	Relationship between the Laplace and Z-transforms —	226
6.4.1	Mapping relation between S-plane and Z-plane —	226

6.4.2	Conversion from Z-transform to Laplace transform —	227
6.4.3	Conversion from the Laplace transform to the Z-transform —	228
6.5	Solution of difference equations with the Z-transform —	230
6.5.1	Analysis of computing zero-input and zero-state response —	230
6.5.2	Analysis of computing overall response —	231
6.6	Z-transfer function of LTID systems —	232
6.6.1	Definition of the Z-transfer function —	232
6.6.2	Characteristic equation, zeros and poles —	234
6.6.3	Nature of the shape of the impulse response for different poles —	234
6.6.4	Stability analysis in the Z-domain —	236
6.7	Signal flow graph and LTID system simulation —	237
6.7.1	Block diagram representation —	237
6.7.2	Model of basic components of LTID systems —	238
6.7.3	Signal flow graph of LTID systems —	239
6.7.4	Simulation of LTID systems —	240
6.8	Characteristics of frequency response —	243
6.8.1	Response of LTID systems to the complex exponential sequence —	243
6.8.2	Response of LTID systems to the sinusoidal sequence —	243
6.8.3	Definition of frequency response of LTID systems —	244
6.8.4	Calculation with MATLAB —	247
6.9	Summary —	248
7	State-space analysis of systems —	255
7.0	Introduction —	255
7.1	Basic concepts of the state space —	255
7.1.1	State variables of systems —	255
7.1.2	State equations of continuous-time and discrete-time systems —	256
7.1.3	Output equations of continuous-time and discrete-time systems —	257
7.2	State-space description of CT systems —	258
7.2.1	State-space description for electrical circuit systems —	258
7.2.2	State-space description from differential equations —	259
7.2.3	State-space description from the system diagram and the flow graph —	261
7.2.4	State-space description with MATLAB —	262
7.3	State-space description of DT systems —	263
7.3.1	State-space description from difference equations —	263
7.3.2	State-space description from system diagrams and flow graphs —	265
7.4	Solution of state-space equations of LTIC systems —	266
7.4.1	Laplace transform solution of state equations —	266
7.4.2	Laplace transform solution of output equations —	267
7.4.3	Calculation with MATLAB —	269
7.5	Solution of state-space equations of LTID systems —	270
7.5.1	Z-transform solution of state equations —	270

7.5.2	Z-transform solution of output equations —	271
7.5.3	Calculation with MATLAB —	273
7.6	Stability analysis from the transfer function matrix —	275
7.6.1	Stability condition —	275
7.6.2	Calculation with MATLAB —	276
7.7	Summary —	277
8	Applications of system analysis —	283
8.0	Introduction —	283
8.1	Application of the Fourier transform in communication systems —	283
8.1.1	Double-sideband suppressed-carrier amplitude modulation (DSB-SC-AM) —	284
8.1.2	Amplitude modulation (AM) —	285
8.1.3	Pulse-amplitude modulation (PAM) —	286
8.2	Fast Fourier transform —	288
8.2.1	Discrete-time Fourier series (DTFS) —	288
8.2.2	Discrete-time Fourier transform (DTFT) —	289
8.2.3	Discrete Fourier transform (DFT) —	290
8.2.4	Relationship between Fourier transforms —	290
8.2.5	Fast Fourier transform (FFT) —	291
8.3	Application of the Laplace transform in control systems —	292
8.3.1	Diagram of the closed-loop feedback system —	292
8.3.2	Analysis of an automatic position control system —	292
8.4	Digital filters —	295
8.4.1	Filter classification —	295
8.4.2	FIR and IIR filters —	296
8.4.3	IIR filter design using the impulse-invariance method —	297
8.4.4	IIR filter design using bilinear transformation —	299
8.4.5	FIR filter design using the windowing method —	301
8.5	Controllability and observability of linear systems —	303
8.5.1	Controllability of linear systems —	304
8.5.2	Observability of linear systems —	305
8.5.3	Calculation with MATLAB —	307
8.6	Applications of the Kalman filter —	307
8.6.1	Basic principles of the Kalman filter —	307
8.6.2	Temperature prediction simulation with MATLAB —	308
8.7	Applications of convolution in image processing —	310
8.8	Summary —	311
