

Contents

1	Introduction	1
1.1	Examples and Terminology	1
1.2	Solvability	9
1.3	Rules of Calculus and Transformations	18
2	Unconstrained Optimization	21
2.1	Optimality Conditions	22
2.1.1	Descent Directions	22
2.1.2	First-Order Optimality Condition	24
2.1.3	Geometric Properties of Gradients	31
2.1.4	Second-Order Optimality Conditions	34
2.1.5	Convex Optimization Problems	44
2.2	Algorithms	48
2.2.1	Descent Methods	49
2.2.2	Step Size Control	55
2.2.3	Gradient Method	62
2.2.4	Variable Metric Methods	68
2.2.5	Newton's Method with and Without Damping	78
2.2.6	Superlinear Convergence	81
2.2.7	Quasi-Newton Methods	85
2.2.8	Conjugate Directions	91
2.2.9	Conjugate Gradient Methods	95
2.2.10	Trust-Region Methods	99
3	Constrained Optimization	107
3.1	Properties of the Feasible Set	108
3.1.1	Topological Properties	109
3.1.2	First-Order Approximations	111
3.2	Optimality Conditions	121
3.2.1	Stationarity	121
3.2.2	Constraint Qualifications	123
3.2.3	Theorems of the Alternative	127
3.2.4	First-Order Optimality Conditions Without Equality Constraints	132
3.2.5	Separation Theorem	138

3.2.6	Normal Cones	143
3.2.7	First-Order Optimality Conditions with Equality Constraints	147
3.2.8	Karush-Kuhn-Tucker Points	155
3.2.9	Second-Order Optimality Conditions	160
3.2.10	Convex Optimization Problems	173
3.3	Algorithms	177
3.3.1	Penalty Methods	178
3.3.2	Multiplier Method	185
3.3.3	Barrier Methods	187
3.3.4	Primal-Dual Interior Point Methods	193
3.3.5	Sequential Quadratic Programming Methods	195
3.3.6	Merit Functions and Filter Methods	200
3.3.7	Quadratic Optimization	204
