- Abstract i**
- Kurzzusammenfassung iii**
- Acknowledgements v**
- List of figures ix**
- List of tables xv**
- List of abbreviations and formula symbols xvii**
- 1 Introduction 1**
 - 1.1 Motivation and research question 1
 - 1.2 Objectives and research hypotheses 2
 - 1.3 Structure of the dissertation 4
- 2 Basics: numerical analysis of the mechanics of unidirectionally fiber-reinforced plastics (UD-FRPs) 5**
 - 2.1 Mechanical modeling of UD-FRPs 5
 - 2.1.1 Micromechanics, anisotropy and homogenization 6
 - 2.1.2 Elasticity at the meso- and macro-scale level 10
 - 2.1.3 Failure at the meso- and macro-scale level 12
 - 2.1.4 Specific use case: pin-loaded strap 17
 - 2.2 Selected basics of the Finite Element Analysis (FEA) 19
 - 2.2.1 Static-structural analyses of linear behavior 19
 - 2.2.2 Static-structural analyses of non-linear behavior 22
- 3 State of the art: filament winding and FEA of filament-wound and skeleton-like composite parts 25**
 - 3.1 Thermoplastic filament winding and the 3D Skeleton Winding technology (3DSW) 25
 - 3.1.1 Materials and semi-finished products for thermoplastic filament winding 26
 - 3.1.2 Robot-based coreless filament winding 30
 - 3.2 Structural FEA of filament-wound and skeleton-like composite parts 33
 - 3.2.1 FEA of closed-surface winding structures 33
 - 3.2.2 FEA of skeleton-like winding structures 34
 - 3.2.3 FEA of skeleton-like composite parts produced in other manufacturing processes 40
- 4 General approach: empirically validated FEA of coreless-wound fiber skeletons (CWFSs) 41**
 - 4.1 Experimentally supported development, validation and application of FEA models for CWFSs 41
 - 4.1.1 Definition, characterization and modeling of the structural constituents – step I-a 42
 - 4.1.2 Analysis and modeling of CWFS geometries – step I-b 44
 - 4.1.3 Development and validation of FEA models for CWFSs – steps I-c, I-d 46
 - 4.1.4 Empirically validated geometry modeling of CWFSs during the pre-prototype phase (PPP) – steps II-a, II-b 47
 - 4.1.5 Practical application of the developed FEA workflow – steps III-a, III-b 49
 - 4.2 Advancement of the current state of the art 50
- 5 Experiments: mechanical and geometric characterization of CWFSs 51**
 - 5.1 Mechanical characterizations 51

5.1.1	Characterizations on constituent-level for model calibration	51
5.1.2	Characterizations on specimen-level for model development and validation	54
5.1.3	Characterizations on component-level as part of practical application	55
5.2	Geometric characterizations	57
5.2.1	Micrograph-based measurement of the characteristic dimensions (CDs) LT and CWW	57
5.2.2	2D scan-based measurement of the CDs OWS and TL.....	58
5.2.3	Handling and determination of the CDs AiW and CWI	59
5.2.4	Generation of CD-values and -regressions for different wrap and shaft configurations	60
6	Modeling: geometry and FEA models of CWFSs	63
6.1	Generation and calibration of sub models on constituent-level.....	63
6.1.1	Impregnated roving (A)	64
6.1.2	Roving-roving interface (B)	66
6.1.3	Insert-roving interface (C)	66
6.1.4	Insert (D)	67
6.2	Generation of integral models on specimen-level	67
6.2.1	Simple loop specimen	67
6.2.2	Inclined loop specimen	71
6.3	Transfer to practical application on specimen- and component-level.....	74
6.3.1	Optimized insert design for the form-fit transfer of oblique loadings.....	74
6.3.2	Empirically validated geometry and FEA modeling of a new CWFS during its PPP.....	77
7	Results and discussion: characterized and computed behavior of CWFSs.....	79
7.1	Mechanical characterizations and model calibration on constituent-level	79
7.1.1	Impregnated roving (A)	79
7.1.2	Roving-roving interface (B)	82
7.1.3	Insert-roving interface (C)	83
7.2	Characterizations and FEA modeling on specimen-level.....	84
7.2.1	Geometric characterization of different loop specimens	84
7.2.2	Investigation of mesh and load step convergence in the FEA of CWFSs.....	90
7.2.3	Mechanical characterization of simple loops and FEA at the meso- and macro-scale	91
7.2.4	Investigation of model sensitivities to CD-variations.....	97
7.2.5	Validation of the FEA workflow by application to the inclined loop specimen.....	99
7.3	Practical application of the developed FEA workflow on specimen- and component-level	101
7.3.1	Comparison of different insert designs for the form-fit transfer of oblique loadings ...	101
7.3.2	Load-compliant dimensioning of a new CWFS during its PPP.....	103
8	Conclusion and outlook	107
8.1	Summary and recommendations for the Finite Element Analysis of coreless-wound fiber skeletons	107
8.2	Limitations of the developed FEA workflow and outlook	109
	List of publications.....	xxiii
	References.....	xxvii
