Introduction	ix
I Geochemistry	
1 The Moon as a celestial body	3
1.1 Size, mass, density	3
1.2 Moment of inertia	3
1.3 Orbital motion	4
1.4 Obliquities and inclinations	5
1.5 Angular momentum	6
1.6 Orbital evolution	7
1.7 Libration points	8
2 The history of the study of the Moon	10
3 The Moon as a geological body	13
3.1 Lunar gravity	13
3.2 Asymmetry of the lunar shape	14
3.3 Magnetic field	15
3.4 Topography	15
3.5 Lunar Rocks	19
3.5.1 Highland rocks	20
3.5.2 Maria rocks	22
3.6 Lunar chronology	23
3.7 Internal structure and temperature	25
4 Similarity and difference in composition of Earth and Moon	29
4.1 Iron content	29
4.2 Redox state	30
4.3 Volatiles	31
4.4 Refractory elements	33
4.5 Thermal evolution	35
4.6 Isotopic composition similarity	36
4.6.1 Oxygen	36

4.6.2	Silicon	39
4.6.3	Titanium	39
4.6.4	Cromium	40
4.6.5	Tangsten	40
4.6.6	Magnesium	41
4.6.7	Litium	41
5	Hypotheses on the origin of the Moon	42
5.1	Early hypotheses	42
5.2	Giant impact concept and its weaknesses	44
6	The model of evaporative accretion	47
6.1	Two possible paths of evolution of the solar nebula	47
6.2	Introduction to the dynamic model	49
6.3	Loss of iron and enrichment in refractories	51
6.4	Asymmetry of accumulation of Earth and Moon	55
7	Geochemical constraints and how the giant impact and evaporative accretion concepts satisfy them	60
7.1	Identity of isotope compositions of the Earth and the Moon	60
7.2	Loss of volatiles without isotope fractionation	61
7.3	Water in the Moon. D/H ratio	65
7.4	Siderophile elements	70
7.5	Constraints following from Hf–W systematic	79
7.6	^{129}I – ^{129}Xe and ^{244}Pu – ^{136}Xe	81
7.7	U–Pb system. Time of accomplishment of accretion	82
7.8	Rb–Sr system. Time of Moon origin	85
II	Dynamics	
8	Dynamical modeling of fragmentation of the gas-dust cloud	93
8.1	Computational modeling using particle dynamics	93
8.2	Computational technique	98
8.2.1	Classical Barnes-Hut algorithm	98
8.2.2	Data structure	101
8.2.3	Tree traversal	103
8.2.4	Parallelization scheme	104
8.2.5	Comparative analysis of the performance	106
8.2.6	Results of the computations, 2D-model	108
8.3	Evaporation of the particles as an important factor of fragmentation	111
8.4	3D-model of evaporative fragmentation	113
8.4.1	Simulation parameters and numerical experiments	113

8.4.2	Modification of the parameters (interaction potential, angular and random velocities, and dissipation coefficients)	116
8.4.3	Variation of number of particles	121
8.4.4	General trends in the system behavior	123
9	Dynamic modeling of accretion	125
9.1	Computational model	125
9.2	Determination of sizes of Earth and Moon embryos	135
9.3	Consideration of precollapse evolution of the gas-dust cloud	137
9.4	Temperature evolution	139
	Conclusions	143
