## Preface — V

|          |                                                                                         |
|----------|-----------------------------------------------------------------------------------------|
| <b>1</b> | <b>Motivation and preliminaries — 1</b>                                                 |
| 1.1      | Introduction — 1                                                                        |
| 1.2      | Motivation: physical background — 3                                                     |
| 1.2.1    | Non-Newtonian fluids — 3                                                                |
| 1.2.2    | Other models — 11                                                                       |
| 1.2.3    | Boundary conditions for fluid flows — 14                                                |
| 1.2.4    | Conclusion and remarks — 16                                                             |
| 1.3      | Motivation: mathematical background — 17                                                |
| 1.4      | Some notation and elementary preliminaries — 19                                         |
| 1.4.1    | Notation — 19                                                                           |
| 1.4.2    | Some algebraic inequalities — 20                                                        |
| 1.4.3    | Some properties of Lebesgue integrable functions — 22                                   |
| 1.4.4    | Some properties of Sobolev functions — 24                                               |
| 1.5      | Variable exponent Lebesgue and Sobolev spaces — 27                                      |
| 1.5.1    | Definition — 27                                                                         |
| 1.5.2    | Basic properties — 29                                                                   |
| 1.5.3    | Maximal and singular operators — 31                                                     |
| 1.6      | Further properties of Sobolev functions — 33                                            |
| 1.6.1    | Embedding theorem — 33                                                                  |
| 1.6.2    | Poincare's inequality — 36                                                              |
| 1.6.3    | Korn's inequality — 39                                                                  |
| 1.6.4    | Lipschitz truncation method — 43                                                        |
| 1.7      | Preliminaries related to hydrodynamics — 48                                             |
| 1.7.1    | Divergence equation, negative norm theorem and De Rham theorem — 48                     |
| 1.7.2    | $L^p$ -theory for Stokes system — 49                                                    |
| 1.8      | Geometry of domain — 52                                                                 |
| 1.8.1    | Geometric properties of domains — 52                                                    |
| 1.8.2    | Geometry related to flattening of boundary — 52                                         |
| <b>2</b> | <b>Existence and higher integrability for steady flows of non-Newtonian fluids — 56</b> |
| 2.1      | The existence of weak solutions — 56                                                    |
| 2.1.1    | Case 1: $p_- > \frac{3n}{n+2}$ — 59                                                     |
| 2.1.2    | Case 2: $\frac{2n}{n+2} < p_- \leq \frac{3n}{n+2}$ — 62                                 |
| 2.2      | Higher integrability of weak solutions — 69                                             |
| 2.2.1    | Global higher integrability — 69                                                        |
| 2.2.2    | Local higher integrability — 75                                                         |
| 2.3      | Bibliographical and further remarks — 76                                                |

|          |                                                                                                  |
|----------|--------------------------------------------------------------------------------------------------|
| <b>3</b> | <b>Higher differentiability for steady flows of non-Newtonian fluids — 79</b>                    |
| 3.1      | Higher differentiability of weak solution: without the convective term — 79                      |
| 3.1.1    | Regularity in tangential directions and interior — 80                                            |
| 3.1.2    | Integrability of all second derivatives of velocity near the boundary — 97                       |
| 3.1.3    | Improvement of regularity of a weak solution — 101                                               |
| 3.2      | Higher differentiability of weak solution: the full problem — 106                                |
| 3.3      | Existence of strong solutions — 112                                                              |
| 3.3.1    | Regularity in cubic domain — 113                                                                 |
| 3.3.2    | Regularity in smooth domain — 125                                                                |
| 3.4      | Bibliographical and further remarks — 130                                                        |
| <b>4</b> | <b>Partial regularity for steady flows of non-Newtonian fluids in 3D — 134</b>                   |
| 4.1      | Auxiliary results — 135                                                                          |
| 4.1.1    | Higher integrability for a frozen generalized Stokes type problem — 135                          |
| 4.1.2    | Higher integrability for a rescaled Stokes-type equation — 135                                   |
| 4.2      | Hölder continuity of gradient of solutions near regular points — 141                             |
| 4.2.1    | Reduction to the problem with a flat boundary — 142                                              |
| 4.2.2    | A correction via divergence equation — 143                                                       |
| 4.2.3    | Comparison estimate with a frozen generalized Stokes-type problem — 143                          |
| 4.2.4    | Excess decay estimate via the blow-up argument — 151                                             |
| 4.2.5    | Hölder continuity of $\nabla \tilde{u}$ near a regular point — 165                               |
| 4.2.6    | Improved Hölder continuity — 171                                                                 |
| 4.3      | Partial $C^{1,\alpha}$ -regularity — 177                                                         |
| 4.3.1    | Hausdorff dimension of singular boundary points — 177                                            |
| 4.3.2    | Boundary partial regularity — 195                                                                |
| 4.3.3    | Interior partial regularity — 196                                                                |
| 4.4      | Bibliographical and further remarks — 196                                                        |
| <b>5</b> | <b><math>C^{1,\alpha}</math>-regularity for steady flows of non-Newtonian fluids in 2D — 199</b> |
| 5.1      | $C^{1,\alpha}_{\text{loc}}$ -regularity of local weak solutions — 199                            |
| 5.2      | The existence of global $C^{1,\alpha}$ -regular solutions — 208                                  |
| 5.3      | Bibliographical and further remarks — 217                                                        |
| <b>6</b> | <b>Calderon–Zygmund estimate for steady flows of non-Newtonian fluids — 219</b>                  |
| 6.1      | A comparison problem — 219                                                                       |
| 6.1.1    | Higher integrability and differentiability for the comparison problem — 220                      |
| 6.1.2    | Comparison estimate — 223                                                                        |
| 6.2      | Calderon–Zygmund-type estimates — 226                                                            |
| 6.2.1    | Good- $\lambda$ -estimate — 227                                                                  |
| 6.2.2    | Local Calderon–Zygmund estimate for the Stokes-type problem — 234                                |
| 6.2.3    | Local Calderon–Zygmund estimate for the full problem — 237                                       |

|          |                                                                                |
|----------|--------------------------------------------------------------------------------|
| 6.2.4    | Boundary value problem — 238                                                   |
| 6.3      | Bibliographical and further remarks — 239                                      |
| <b>7</b> | <b>Hölder continuity for 2D unsteady flows of non-Newtonian fluids — 242</b>   |
| 7.1      | The main result and preliminaries — 242                                        |
| 7.1.1    | The main result — 242                                                          |
| 7.1.2    | The outline of the proof — 244                                                 |
| 7.1.3    | Preliminaries — 246                                                            |
| 7.2      | Global regularity of solution of an approximate problem — 247                  |
| 7.3      | The regularity of the approximate solutions independent of the parameter — 248 |
| 7.3.1    | A priori estimate — 249                                                        |
| 7.3.2    | Regularity of the time derivative of velocity — 249                            |
| 7.3.3    | Estimate in the tangential direction — 252                                     |
| 7.3.4    | Estimate in all directions — 256                                               |
| 7.3.5    | Improvement of regularity of the approximate solution — 261                    |
| 7.4      | Proof of the main result — 264                                                 |
| 7.4.1    | Proof of (7.1.3) — 264                                                         |
| 7.4.2    | Proof of (7.1.4) — 266                                                         |
| 7.4.3    | Uniqueness — 271                                                               |
| 7.5      | Bibliographical and further remarks — 271                                      |
| <b>A</b> | <b>Standard notations — 273</b>                                                |
| A.1      | Matrices and vectors — 273                                                     |
| A.2      | Sets and geometric notations — 273                                             |
| A.3      | Functions — 274                                                                |
| A.4      | Differential symbols — 274                                                     |
| A.5      | Function spaces — 275                                                          |
| A.6      | Convergence — 275                                                              |

**Bibliography — 277**

**Index — 297**
