|----------|------------------------------------------------------|-----------|
| <b>1</b> | <b>Introduction</b>                                  | <b>3</b>  |
| <b>2</b> | <b>Theoretical background</b>                        | <b>5</b>  |
| 2.1      | Fundamentals . . . . .                               | 5         |
| 2.1.1    | Laser pulses . . . . .                               | 5         |
| 2.1.2    | Optical fibers . . . . .                             | 9         |
| 2.2      | Microchip lasers (MCLs) . . . . .                    | 18        |
| 2.2.1    | Basic concept . . . . .                              | 18        |
| 2.2.2    | Characteristics . . . . .                            | 22        |
| 2.3      | Optical effects in fibers . . . . .                  | 28        |
| 2.3.1    | Chromatic dispersion . . . . .                       | 28        |
| 2.3.2    | Nonlinear effects . . . . .                          | 33        |
| <b>3</b> | <b>Dispersions-free pulse shortening</b>             | <b>41</b> |
| 3.1      | Principle and characteristics . . . . .              | 41        |
| 3.1.1    | Basic principle . . . . .                            | 41        |
| 3.1.2    | Graphical model . . . . .                            | 43        |
| 3.1.3    | Specific properties . . . . .                        | 45        |
| 3.1.4    | Numerical simulations . . . . .                      | 50        |
| 3.2      | Experimental investigations . . . . .                | 52        |
| 3.2.1    | Pump setup and preamplifiers . . . . .               | 52        |
| 3.2.2    | Proof-of-principle experiment . . . . .              | 55        |
| 3.2.3    | Achieved results . . . . .                           | 57        |
| 3.3      | Pulse shortening with smoothed SPM spectra . . . . . | 60        |
| 3.3.1    | Evolution of the smoothing effect . . . . .          | 60        |
| 3.3.2    | Applying the smoothing effect . . . . .              | 63        |
| 3.4      | Comparison to other methods . . . . .                | 65        |

|          |                                                       |           |
|----------|-------------------------------------------------------|-----------|
| <b>4</b> | <b>Subsequent amplification and pulse compression</b> | <b>68</b> |
| 4.1      | Subsequent amplification . . . . .                    | 68        |
| 4.1.1    | Power amplifier . . . . .                             | 69        |
| 4.1.2    | Achieved results . . . . .                            | 70        |
| 4.2      | Pulse compression . . . . .                           | 72        |
| 4.2.1    | Principle and properties . . . . .                    | 73        |
| 4.2.2    | Experimental investigations . . . . .                 | 74        |
| <b>5</b> | <b>Combination of the pulse-shortening methods</b>    | <b>79</b> |
| 5.1      | Principle and characteristics . . . . .               | 79        |
| 5.2      | Experimental investigations . . . . .                 | 83        |
| 5.2.1    | Proof-of-principle experiment . . . . .               | 83        |
| 5.2.2    | Achieved results . . . . .                            | 85        |
| 5.3      | All-fiber pulse-shortening system . . . . .           | 87        |
| 5.3.1    | All-fiber approach for sub-200 fs pulses . . . . .    | 87        |
| 5.3.2    | Technical realization and achieved results . . . . .  | 88        |
| <b>6</b> | <b>Conclusion and outlook</b>                         | <b>93</b> |
