

CONTENTS

A Statistical physics 1

B Thermodynamics 5

 B.1 Ideal classical gases 5

 B.1.1 Van der Waals-gases 6

 B.1.2 Phenomenological temperature measurements 6

 B.2 Zeroth law of thermodynamics 7

 B.2.1 Exact and closed differentials 7

 B.3 First law of thermodynamics 8

 B.3.1 Isochoric changes of state 9

 B.3.2 Adiabatic changes of state 9

 B.3.3 Isobaric changes of state 10

 B.3.4 Adiabatic index of a gas 11

 B.3.5 Entropy 11

 B.4 Second law of thermodynamics 12

 B.4.1 Conversion from thermal to mechanical energy 12

 B.4.2 Generalised Carnot-engines 14

 B.4.3 Entropy and energy conversion 15

 B.4.4 Irreversible processes and entropy increase in closed systems . 16

 B.4.5 Concave functions and Legendre transforms 16

 B.5 Third law of thermodynamics 17

C Probability theory 19

 C.1 Kolmogorov axioms for probability 19

 C.2 Laplace probability 19

 C.3 Conditional probabilities and Bayes' law 20

 C.4 Random variables 20

 C.5 Characteristic function and moment generating function 21

 C.6 Information entropies 23

D Microcanonical ensemble 29

 D.1 Virial theorem 31

 D.2 Energy conservation 34

 D.3 Legendre transforms and the Hamilton-function 34

 D.4 Hamilton-equations of motion 35

 D.5 Canonical transforms 36

E Phase space dynamics 39

 E.1 Phase space Γ 39

 E.2 Phase space density ρ 39

 E.3 Phase space volume: surface and volume 40

 E.4 Microcanonical ensemble 41

 E.5 Equipartition theorem 42

 E.6 Entropy for Hamiltonian systems 44

 E.7 Adiabatic invariance of entropy 45

 E.7.1 Example: adiabatic invariance in a string pendulum 47

 E.8 Entropy as phase space volume at fixed energy 50

 E.9 Gibbs-paradox 51

 E.10 Thermal wavelength λ_{th} 53

F	Canonical ensemble	57
F.1	Marginalisation procedure	57
F.2	Canonical ensemble	60
F.3	Equipartition theorem	61
F.4	Canonical partition function	61
F.5	Helmholtz-free energy F	62
F.6	Gibbs-enthalpy	63
G	Macrocanonical ensemble	67
G.1	Macrocanonical ensemble	67
G.2	Macrocanonical potential J and macrocanonical partition $\mathcal{Z}$	68
G.3	Chemical potential μ and fugacity z	68
H	Quantum statistics	73
H.1	Averages in classical and quantum physics	73
H.2	Quantum mechanical partitions	76
H.2.1	Construction of phase space densities	76
H.2.2	Canonical ensemble in quantum statistics	76
H.2.3	Canonical averages of arbitrary observables	77
H.2.4	Macrocanonical ensembles in quantum statistics	78
H.3	Symmetries of wave functions of many particles	79
H.4	Non-interacting systems	80
H.5	Macrocanonical ensembles in quantum statistics	81
H.5.1	Ultrarelativistic ideal Bose-gas	87
H.5.2	Planck-spectrum	89
H.6	Fluctuations in quantum and classical statistics	92
H.7	Third law of thermodynamics and entropy at absolute zero	97
H.8	Fermionic statistics and the exclusion principle	99
H.8.1	Density of states for non-relativistic fermions	100
H.8.2	Fermi-gases	102
H.8.3	Degenerate Fermi-gases in the limit $T \rightarrow 0$	103
H.9	Ideal non-relativistic Bose-gas	104
I	Phase transitions	113
I.1	Van der Waals-gases	113
I.1.1	Typical shapes of interaction potentials	114
I.2	Ising-model for ferromagnetism	117
I.2.1	Transfer matrix method for the Ising-model	118
I.2.2	Isothermal susceptibility χ	120
I.3	Metropolis-Hastings algorithm and the Ising model in 2d	120
J	Stochastic differential equations	125
J.1	Brownian motion	125
J.1.1	Langevin-equation	126
J.1.2	Random walks	127
J.2	Fokker-Planck-equation and evolution of distributions	128
J.3	Spectral decomposition of random forces $\sigma\eta(t)$	130
J.4	Irreversible processes	131
J.4.1	Irreversibility in statistical physics	131
J.4.2	Reversibility in classical mechanics	134

X	Mathematical supplement	137
X.1	Relative information entropies	137
X.2	Volume and area of the unit sphere	138
Y	Physical supplement	141
Y.1	Gibbs-Duhem relation and intensive state variables	141
Y.2	Euler-relation	141
