Chapter one: What about diversity?	12
A philosophical dilemma.	16
A question of purpose	19
Geographic scope	21
Chapter two: Classical defining of botanical species.	24
Abstraction of form	24
A critique of classical species definition	32
Chapter three: Forest composition.	41
Common species	44
Gap dynamics	45
Tree size	46
A painter's view of the forested landscape	52
Chapter four: Maritime climate	59
Temperature and precipitation.	60
Climate as a limiting factor	66
Climate change	68
Acid rain	74
Chapter five: Marginal soils.	79
Water storage	80
Water potential	83
Spring soil warming	86
Acid soils	89
Chapter six: Diversity of juvenile allometry, phenology, and plasticity	93
A mechanistic approach.	93
Beech <i>versus</i> fir	100
Beech <i>versus</i> moose maple	106
Survival of paper birch, yellow birch, and hemlock	113
Fir and paper birch on cleared siege sites near Louisbourg	120
Chapter seven: Diversity of tree growth rates.	126
Tree cores	129
Repeated measurements	133
Chapter eight: A glimpse of organic dynamics	137
A weed in the woods! Really?	139
Deadwood	142
Why so much water?	145
More than nitrogen	146
Chapter nine: Human agency in the forest	152
Agriculture and wood exploitation	153
Sylviculture	160
