Preface	V
1 Introduction (L. Zentner, S. Linß)	1
2 Definition and classification of compliant systems (L. Zentner, S. Linß)	3
2.1 Compliance.....	4
2.1.1 Classification of compliance.....	4
2.1.2 Variation of compliance	5
2.2 Compliant mechanisms.....	8
2.2.1 Classification of compliant mechanisms	8
2.2.2 Compliant joints	9
2.3 Compliant actuators and sensors.....	14
2.3.1 Compliant actuators.....	14
2.3.2 Compliant sensors.....	15
2.3.3 Multi-functionality.....	19
2.4 Motion behavior of compliant systems	20
2.4.1 Stable motion behavior	21
2.4.2 Unstable motion behavior.....	23
3 Modeling compliant systems as rigid-body systems (L. Zentner)	29
3.1 Assumptions for modeling.....	29
3.2 Modeling for individual load cases.....	33
3.3 Modeling for complex loads	34
3.4 Modeling for concentrated compliance	36
3.5 Comparison of the methods	37
3.6 Serial cascading rigid-body joints.....	38
3.7 Modeling examples.....	41
3.7.1 A gripping system with two joints	41
3.7.2 A gripping system with multiple joints.....	43
3.7.3 Parallel cascading compliant elements	45

4	Modeling large deflections of curved rod-like structures (<i>L. Zentner</i>)	49
4.1	Assumptions for modeling	49
4.2	Equilibrium conditions for a rod element	52
4.2.1	Equilibrium conditions in vector form	52
4.2.2	Derivative of the unit vectors	54
4.2.3	Natural coordinate system	56
4.2.4	Relationship between the natural coordinate system and attached coordinate system	58
4.2.5	Further development of the equilibrium equations	60
4.3	Inclusion of material properties	60
4.4	Transformation of unit vectors	66
4.5	Shape of the rod in coordinate systems	70
4.6	Displacement vector	72
4.7	Summarizing representation of equations for large deflections	74
4.7.1	Vector form of model equations in attached coordinate system in a space	74
4.7.2	Scalar form of model equations in attached coordinate system in a space	76
4.7.3	Scalar form of model equations in attached coordinate system in a plane	78
4.7.4	Vector form of model equations in Cartesian coordinate system in a space	80
4.7.5	Scalar form of model equations in Cartesian coordinate system in a space	82
4.7.6	Scalar form of model equations in Cartesian coordinate system in a plane	84
5	Examples of modeling large deflections of curved rod-like structures (<i>L. Zentner</i>)	87
5.1	Plane problems in the attached coordinate system	89
5.1.1	A pneumatically actuated gripping finger	89
5.1.2	A pipe with flowing liquid	92
5.1.3	A coated hollow rod	96
5.1.4	Rods with non-constant cross-sections	99
5.2	Spatial problems in the attached coordinate system	102
5.2.1	A helical rod under internal pressure	102
5.2.2	A drill-bit under load due to a moment	107
5.3	Plane problems in the Cartesian coordinate system	110
5.3.1	A sensor for measuring dynamic pressures	110
5.3.2	Compliant elements for monitoring angular velocity	112
5.3.3	A gripping device with a compliant body	115
5.3.4	Two compliant mechanisms	121
5.4	Spatial problems in the Cartesian coordinate system	124
5.4.1	A compliant valve	124
5.4.2	A gripping tool with curved compliant fingers	127

6	Synthesis of compliant mechanisms and design of flexure hinges (<i>S. Linß</i>)	133
6.1	Rigid-body replacement approach	133
6.2	Types of flexure hinges	135
6.3	Types of notch flexure hinges and suggested contour shapes.....	138
6.4	Angle-based synthesis method for individually shaped flexure hinges in a mechanism	141
6.4.1	Design of polynomial flexure hinges with variable order using design graphs	144
6.4.2	Design of various flexure hinges with variable dimensions using design equations.....	146
6.5	Examples of compliant mechanisms with polynomial flexure hinge design	149
6.5.1	Angle-based synthesis of a high-precision and large-stroke straight-line mechanism with different polynomial hinges	150
6.5.2	Further examples of synthesized mechanisms	153
