Abstract	ix
Kurzfassung	xi
Acknowledgments	xiii
List of abbreviations	xv
1 General introduction	1
1.1 Motivation	2
1.2 Problem statement	3
1.3 Thesis objectives and focus	4
1.4 Thesis structure	5
2 Theoretical background on epilepsy and seizures classification	9
2.1 Epilepsy and seizures specifications	9
2.1.1 Classification of epileptic seizure types	9
2.1.2 Focal and generalized seizures	11
2.1.3 Unknown and unclassified seizure	13
2.2 Electroencephalography (EEG)	15
2.2.1 Brain structure and function	15
2.2.2 Acquisition methods for EEG signal	15
2.2.3 Brain wave patterns	18
2.2.4 EEG artifacts, types and effects on signal integrity	19
2.2.5 Signal filtering and feature extraction techniques	22
2.3 Surface electromyography (sEMG)	24
2.3.1 Principles of sEMG in muscle monitoring	24
2.3.2 Acquisition methods for sEMG signal recording	25
2.3.3 Feature extraction and analysis in sEMG signal processing	28
2.4 Inertial measurement unit (IMU)	30
2.4.1 Working principle of IMU in the monitoring of body movement	30
2.4.2 Data acquisition and pre-processing	31

- 2.5 Concluding remarks 31
- 3 State of art of epileptic seizure detection and classification 33
 - 3.1 Single modality-based seizure detection and classification 33
 - 3.1.1 Self-report-based method 34
 - 3.1.2 Video-based method 35
 - 3.1.3 EEG-based modality 36
 - 3.1.4 sEMG-based modality 46
 - 3.1.5 IMU-based modality 49
 - 3.2 Multimodal-based seizure detection and classification 52
 - 3.3 Proposed methodology 56
- 4 Signal acquisition and feature engineering 59
 - 4.1 Acquisition and pre-processing of recorded modalities 59
 - 4.1.1 Design of an sEMG and IMU combined measurement system 59
 - 4.1.2 Simultaneous sEMG and IMU data acquisition 64
 - 4.1.3 EEG measurements 69
 - 4.1.4 EEG signal pre-processing 71
 - 4.2 Feature Engineering of recorded modalities 77
 - 4.2.1 sEMG feature extraction 77
 - 4.2.2 sEMG feature selection and importance evaluation 81
 - 4.2.3 IMU feature extraction and evaluation 85
 - 4.2.4 EEG feature extraction 86
 - 4.2.5 EEG feature selection and importance evaluation 92
 - 4.3 Concluding remarks 97
- 5 Machine learning models for epileptic seizure classification 99
 - 5.1 Potential of sEMG modality in the classification of epileptic seizure 99
 - 5.1.1 Models architecture and working principle 100
 - 5.1.2 Model evaluation over different sensors combination . . . 103
 - 5.2 Potential of IMU modality in the classification of epileptic seizure 108
 - 5.2.1 Models development and evaluation 108
 - 5.2.2 Comparison to the state of the art 110
 - 5.3 Potential of EEG modality in the classification of epileptic seizure 111
 - 5.3.1 Models development and hyper-parameters setup 111
 - 5.3.2 Model evaluation over different sensors and feature combinations 113
 - 5.3.3 Results comparison with mutual information 121
 - 5.3.4 Comparison to the state of the art 124
 - 5.4 Concluding remarks 126

6	Epilepsy classification based on multi-modal measurement signals	127
6.1	Data acquisition of different modalities in a real-world scenario	127
6.1.1	Measurement setup	127
6.1.2	Specifications of the recorded seizures	129
6.2	Potential of single modality in the classification of epileptic seizures	132
6.2.1	Potential of sEMG features in the classification of targeted seizures	132
6.2.2	Potential of EEG features in the classification of targeted seizures	135
6.2.3	Potential of IMU features in the classification of targeted seizures	136
6.3	Potential of multi-modal features in the classification of targeted seizures	142
6.4	Concluding remarks	145
6.5	Comparison to the state of the art	147
7	General conclusion and perspectives	149
	Bibliography	153
	Publications	177
	Scientific Reports on Measurement and Sensor Technology	181
