

Contents

Preface — V

Chapter 1

Characteristics of separation processes — 1

- 1.1 Significance of separations — 1
- 1.2 Characteristics of separation processes — 4
 - 1.2.1 Categorization — 4
 - 1.2.2 Separating agents — 5
 - 1.2.3 Separation factors — 7
- 1.3 Industrial separation methods — 8
 - 1.3.1 Exploitable properties — 8
 - 1.3.2 Important molecular separations — 11
- 1.4 Inherent selectivities — 12
 - 1.4.1 Equilibrium-based processes — 12
 - 1.4.2 Rate controlled processes — 13
- Nomenclature — 14
- Exercises — 14

Chapter 2

Evaporation and distillation — 16

- 2.1 Separation by evaporation — 16
 - 2.1.1 Introduction — 16
 - 2.1.2 Vapor–liquid equilibria — 17
- 2.2 Separation by single-stage partial evaporation — 22
 - 2.2.1 Differential distillation — 22
 - 2.2.2 Flash distillation — 23
 - 2.2.2.1 Specifying T and L/V — 24
 - 2.2.2.2 Specifying T and P_{tot} — 26
- 2.3 Multistage distillation — 27
 - 2.3.1 Distillation cascades — 27
 - 2.3.2 Column distillation — 28
 - 2.3.3 Feasible distillation conditions — 29
 - 2.3.4 External column balances — 31
- 2.4 McCabe–Thiele analysis — 31
 - 2.4.1 Internal balances — 31
 - 2.4.1.1 Rectifying section — 32
 - 2.4.1.2 Stripping section — 33
 - 2.4.1.3 Feed stage considerations — 34
 - 2.4.1.4 Feed line — 35
 - 2.4.2 Required number of equilibrium stages — 37

2.4.2.1	Graphical determination of stages and location of feed stage —	37
2.4.2.2	Limiting conditions —	39
2.4.2.3	Fenske and Underwood equations —	39
2.4.2.4	Use of Murphree efficiency —	42
2.4.3	Energy requirements —	43
2.5	Advanced distillation techniques —	45
2.5.1	Batch distillation —	45
2.5.2	Continuous separation of multiple product mixtures —	45
2.5.3	Separation of azeotropes —	47
2.6	Energy-efficient evaporation and distillation —	49
2.6.1	Evaporation —	49
2.6.2	Distillation —	51
	Nomenclature —	55
	Exercises —	56

Chapter 3

Absorption and stripping — 61

3.1	Introduction —	61
3.2	The aim of absorption —	63
3.3	General design approach —	64
3.4	Absorption and stripping equilibria —	65
3.4.1	Gaseous solute solubilities —	65
3.4.2	Minimum absorbent flow —	67
3.5	Absorber and stripper design —	68
3.5.1	Operating lines for absorption —	68
3.5.2	Stripping analysis —	72
3.5.3	Analytical Kremser solution —	73
3.6	Industrial absorbers —	76
3.6.1	Packed columns —	77
3.6.2	Plate columns —	78
3.6.3	Spray and bubble columns —	78
3.6.4	Comparison of absorption columns —	79
	Nomenclature —	81
	Exercises —	81

Chapter 4

General design of gas/liquid contactors — 84

4.1	Introduction —	84
4.2	Modeling mass transfer —	84
4.3	Plate columns —	90
4.3.1	Dimensioning a tray column —	91

4.3.2	Height of a tray column — 93
4.3.2.1	Tray spacing — 93
4.3.2.2	Tray efficiency — 93
4.3.2.3	Transfer units — 94
4.3.2.4	Overall efficiency — 96
4.3.3	Diameter of a tray column — 98
4.3.3.1	Flooding — 99
4.3.3.2	Downcomer flooding — 100
4.3.3.3	Entrainment flooding — 102
4.3.3.4	Remark on flooding charts — 103
4.4	Packed columns — 104
4.4.1	Random packing — 105
4.4.2	Structured packing — 106
4.4.3	Dimensioning a packed column — 107
4.4.4	Height of a packed column — 108
4.4.4.1	Transfer units — 108
4.4.5	Minimum column diameter — 111
4.4.6	Pressure drop — 113
4.5	Criteria for column selection — 114
	Nomenclature — 115
	Exercises — 116

Chapter 5

Liquid-liquid extraction — 120

5.1	Introduction — 120
5.1.1	General introduction — 120
5.1.2	Liquid-liquid equilibria — 123
5.1.3	Solvent selection — 125
5.2	Extraction schemes — 128
5.2.1	Single equilibrium stage — 128
5.2.2	Cocurrent cascade — 129
5.2.3	Crosscurrent — 130
5.2.4	Countercurrent — 131
5.3	Design of countercurrent extractions — 133
5.3.1	Graphical McCabe-Thiele method for immiscible systems — 133
5.3.2	Analytical Kremser method for immiscible systems — 135
5.3.3	Graphical method for partial miscible systems — 136
5.3.4	Efficiency of an ideal nonequilibrium mixer — 141
5.4	Industrial liquid-liquid extractors — 143
5.4.1	Mixer-settlers — 143
5.4.2	Mechanically agitated columns — 144

- 5.4.3 Unagitated and pulsed columns — **145**
- 5.4.4 Centrifugal extractors — **146**
- 5.4.5 Selection of an extractor — **147**
- Nomenclature — **150**
- Exercises — **151**

Chapter 6

Adsorption and ion exchange — 159

- 6.1 Introduction — **159**
- 6.2 Adsorption fundamentals — **162**
 - 6.2.1 Industrial adsorbents — **162**
 - 6.2.2 Equilibria — **168**
 - 6.2.3 Kinetics — **172**
- 6.3 Fixed-bed adsorption — **175**
 - 6.3.1 Bed profiles and breakthrough curves — **175**
 - 6.3.2 Equilibrium theory model — **177**
 - 6.3.3 Modeling of mass transfer effects — **179**
- 6.4 Basic adsorption/desorption cycles — **180**
 - 6.4.1 Temperature swing — **182**
 - 6.4.2 Pressure swing — **182**
 - 6.4.3 Inert and displacement purge cycles — **185**
- 6.5 Principles of ion exchange — **186**
 - 6.5.1 Ion exchange resins — **186**
 - 6.5.2 Equilibria and selectivity — **187**
- 6.6 Ion exchange processes — **189**
 - Nomenclature — **191**
 - Exercises — **191**

Chapter 7

Drying of solids — 197

- 7.1 Introduction — **197**
- 7.2 Humidity of carrier gas — **198**
 - 7.2.1 Definitions — **198**
 - 7.2.2 System air–water: a special case — **200**
 - 7.2.3 Psychrometric charts — **201**
- 7.3 Moisture in solids — **203**
 - 7.3.1 Bound and unbound water — **203**
- 7.4 Drying mechanisms — **207**
 - 7.4.1 Constant drying rate — **208**
 - 7.4.2 Falling drying rate — **209**
 - 7.4.3 Estimation of drying time — **210**

7.5	Classification of drying operations —	212
7.5.1	Direct heat dryers —	213
7.5.1.1	Batch compartment dryers —	213
7.5.1.2	Belt dryers —	214
7.5.1.3	Rotary dryers —	215
7.5.1.4	Flash dryers —	217
7.5.1.5	Fluidized bed dryers —	217
7.5.1.6	Spray dryers —	217
7.5.2	Contact dryers —	218
7.5.2.1	Rotary and agitator dryers —	219
7.5.2.2	Vacuum dryers —	220
7.5.2.3	Fluid bed dryers —	220
7.5.3	Other drying methods —	220
7.6	Energy-efficient drying —	221
7.6.1	Operating conditions —	221
7.6.2	Energy recovery —	223
	Nomenclature —	224
	Exercises —	225

Chapter 8

Crystallization — 230

8.1	Introduction —	230
8.2	Crystal quality parameters —	235
8.2.1	Crystal size distribution —	236
8.2.2	Morphology —	237
8.2.3	Crystal form —	238
8.2.4	Purity —	239
8.2.5	Interdependency among crystal quality parameters —	240
8.3	Phase diagrams —	241
8.3.1	Predicting solubility curves —	244
8.3.2	Measuring solubility curves —	244
8.4	Kinetics of crystallization —	245
8.4.1	Metastable zone limit —	246
8.4.2	Measuring metastable zone width —	247
8.4.3	Supersaturation —	247
8.4.4	Theory —	249
8.4.5	Nucleation —	250
8.4.6	Crystal growth —	255
8.4.7	Population balance equations for the MSMPR crystallizer —	259
8.5	Methods of supersaturation generation —	262
8.5.1	Cooling —	262

8.5.2	Evaporation —	263
8.5.3	Vacuum crystallization —	263
8.5.4	Precipitation —	264
8.5.5	Antisolvent crystallization —	265
8.5.6	Melt crystallization —	265
8.5.7	Choosing a method of supersaturation generation —	266
8.6	Basic design for industrial crystallizers —	267
8.6.1	Process and design specifications —	268
8.6.2	Thermodynamic and lab-scale kinetic information —	269
8.6.3	Design decisions —	269
8.6.3.1	Selecting method of supersaturation generation —	270
8.6.3.2	Operation modes: batch versus continuous operation —	271
8.6.3.3	Number of stages: single- and multistage operation selection —	272
8.6.3.4	Selecting the crystallizer type —	273
8.6.3.5	Stirred tank and cooling disk crystallizer —	274
8.6.3.6	Forced circulation crystallizers —	274
8.6.3.7	Draft tube baffle crystallizer —	276
8.6.3.8	Fluidized bed crystallizers —	276
8.6.3.9	Melt crystallizers —	277
8.6.3.10	Vacuum crystallizers —	278
8.7	Crystallizer calculations —	279
8.7.1	Mass balance —	280
8.7.2	Basic yield calculations —	281
8.7.3	Enthalpy balance —	282
8.7.4	Crystallizer dimensions —	282
8.8	Final design procedure —	283
8.8.1	Economic evaluation —	283
8.8.2	Detailed design with production-scale kinetic data —	285
8.8.3	Sustainability in industrial crystallization —	285
	Nomenclature —	288
	Exercises —	289

Chapter 9

Sedimentation and settling — 292

9.1	Introduction —	292
9.2	Gravity sedimentation —	293
9.2.1	Sedimentation mechanisms —	294
9.2.2	Dilute sedimentation —	296
9.2.3	Hindered settling —	299

9.2.4	Continuous sedimentation tank (gravity settling tank) —	300
9.2.5	Gravity sedimentation equipment —	302
9.2.6	Brownian motion and its influence on sedimentation —	303
9.2.7	Colloidal stability —	305
9.3	Centrifugal sedimentation —	306
9.3.1	Particle velocity in a centrifugal field —	306
9.3.2	Sedimenting centrifuges —	307
9.3.3	Bowl centrifuge separation capability —	310
9.3.4	The sigma concept —	311
9.3.5	Capacity of disk centrifuges —	313
9.3.6	Hydrocyclones —	315
9.4	Electrostatic precipitation —	318
9.4.1	Principles —	318
9.4.2	Equipment and collecting efficiency —	319
	Nomenclature —	322
	Exercises —	323

Chapter 10

Filtration — 326

10.1	The filtration process —	326
10.2	Filtration fundamentals —	329
10.2.1	Flow through packed beds —	329
10.2.2	Cake filtration —	330
10.2.3	Constant pressure and constant rate filtration —	331
10.2.4	Compressible cakes —	333
10.3	Filtration equipment —	334
10.3.1	Continuous large-scale vacuum filters —	335
10.3.2	Batch vacuum filters —	337
10.3.3	Pressure filters —	339
10.4	Filter media —	341
10.5	Centrifugal filtration —	343
10.5.1	Centrifugal filters —	343
10.5.2	Filtration rates in centrifuges —	344
10.6	Interceptive filtration —	347
10.6.1	Deep bed filtration —	347
10.6.2	Impingement filtration of gases —	348
10.6.3	Interception mechanisms —	349
10.6.4	Lamellar plate separators —	350
	Nomenclature —	352
	Exercises —	353

Chapter 11

Membrane filtration — 357

- 11.1 Introduction — **357**
- 11.2 Membrane selection — **358**
- 11.3 Membrane filtration processes — **360**
- 11.4 Flux equations and selectivity — **363**
 - 11.4.1 Flux definitions — **364**
 - 11.4.2 Permeability for diffusion in porous membranes — **365**
 - 11.4.3 Permeability for solution-diffusion in dense membranes — **367**
 - 11.4.4 Selectivity and retention — **368**
- 11.5 Concentration polarization — **369**
- 11.6 Membrane modules — **372**
 - 11.6.1 Design procedure — **376**
 - 11.6.2 Solution — **376**
- 11.7 Concluding remarks — **379**
 - Nomenclature — **380**
 - Exercises — **380**

Chapter 12

Separation method selection — 383

- 12.1 Introduction — **383**
- 12.2 Factors influencing the choice of a separation process — **385**
 - 12.2.1 Technical feasibility — **386**
 - 12.2.2 Product stability — **386**
 - 12.2.3 Economics — **387**
 - 12.2.4 Sustainability — **388**
 - 12.2.5 Design reliability — **390**
- 12.3 Selection of feasible separation processes — **391**
 - 12.3.1 Classes of processes — **391**
 - 12.3.2 Initial screening — **392**
 - 12.3.3 Separation factor — **394**
- 12.4 Separation of homogeneous liquid mixtures — **395**
 - 12.4.1 Strengths of distillation — **397**
 - 12.4.2 Limitations of distillation — **399**
 - 12.4.3 Low relative volatilities — **401**
 - 12.4.4 Overlapping boiling points — **403**
 - 12.4.5 Low concentrations — **405**
 - 12.4.6 Dissolved solids — **406**
- 12.5 Separation systems for gas mixtures — **407**
 - 12.5.1 General selection considerations — **407**
 - 12.5.2 Comparison of gas separation techniques — **409**

- 12.5.2.1 Absorption — **409**
- 12.5.2.2 Adsorption — **409**
- 12.5.2.3 Membrane separation — **410**
- 12.6 Separation methods for solid–liquid mixtures — **411**
 - Exercises — **413**

Appendix Answers to exercises — 417

References and further reading — 429

Index — 433
