Kurzfassung	vii
Abstract	ix
List of Author's Publications	xi
Nomenclature	xix
1 Introduction	1
1.1 Motivation	1
1.2 Scope	3
1.3 Objectives and Contributions	5
1.4 Thesis Outline	5
2 Fundamentals of the Operation of Electric Power Systems and Mathematical Optimization	7
2.1 Grid Operation in Germany	7
2.1.1 Grid Operation Overview and System Operator Sovereignty . . .	7
2.1.2 Operational Processes	10
2.1.3 Voltage and Reactive Power Coordination	13
2.2 Mathematical Optimization and Multi-Objective Optimization	15
2.2.1 Mathematical Optimization	16
2.2.2 Algorithms for Considered Mathematical Optimization Problems .	18
2.2.3 Multi-Objective Optimization Algorithms	21
2.2.4 Normalized Cost Algorithm as a Performance Indicator	23
3 Modeling for the Optimization of Power System Operation	27
3.1 Balanced Three-Phase Power Flow Analysis	27
3.2 Balanced Three-Phase Optimal Power Flow Formulation for Grid Operation	29
3.2.1 Control Variables	29
3.2.2 Objectives	30
3.2.3 Constraints	32
3.3 Reference Control Methods for the Comparison with Distributed Optimization Methods	35
3.3.1 State-of-the-art Grid Operation with Local Control	35
3.3.2 Centralized Multi-Objective Optimal Power Flow	37

3.4	Study Cases and Analysis Setup	37
3.4.1	Grid Data from the Literature	37
3.4.2	New Open Benchmark Dataset: SimBench	38
3.4.3	Simulation and Optimization Setup	41
3.5	Representation of Grids of Neighboring System Operators	42
3.5.1	Definition of System Operator Boundaries	43
3.5.2	Grid Equivalent Comparison	43
4	Analysis of Existing Distributed Optimization Methods	55
4.1	Classification of Existing Distributed Optimization Methods	55
4.1.1	Mathematical Decomposition Methods	56
4.1.2	Methods with Iteratively Updated Grid Equivalents	57
4.1.3	Sequential Methods	57
4.2	Mathematical Decomposition Method with Lagrangian Relaxation	58
4.2.1	Copy Variables in Decomposition Methods	58
4.2.2	Complicating Constraints in Decomposition Methods	59
4.2.3	Comparison of Decomposition Method Approaches	59
4.2.4	Implemented Algorithm of a Decomposition Method with Lagrangian Relaxation	60
4.3	Methods with Iteratively Updated Grid Equivalents	61
4.4	DSO-TSO-DSO Chain	63
4.5	Simulation Results for a Performance Comparison	64
4.5.1	Iterative Convergence Behavior	65
4.5.2	Time Series Results	68
4.6	Discussion on Method Suitability	69
4.7	Conclusions	72
5	New Approach based on Coordinating Boundary Variables	73
5.1	Concept of the Approach	73
5.2	Reachability of Combinations of Boundary Variables	74
5.3	Unweighted Agreement Procedure for Boundary Variables	79
5.3.1	Deviation from agreed boundary variable values	83
5.3.2	Performance Evaluation and Explanation of Overall Objective Values	87
5.3.3	Conclusions	89
5.4	Equivalent Function Method	90
5.4.1	Overall Procedure	90
5.4.2	Multi-Objective Algorithm with Equivalent Functions	91
5.4.3	Scalability and Realizability	96
5.4.4	Sovereignty and Data Exchange	96

5.4.5	Simulation Results	97
5.4.6	Limits of the Equivalent Function Method	101
5.5	Conclusions	102
6	Conclusions and Outlook	105
6.1	Summary	105
6.2	Contributions	107
6.3	Outlook	108
A	Appendix	111
A.1	Technical Rules for Grid Connection of Power Plants to EHV and HV Grids	111
A.1.1	Approximation of the Technical Rules for Grid Connection at 220 kV and 110 kV	112
A.2	Details on the Exemplification of the Normalized Cost Algorithm	113
A.2.1	Normalization Factors in Problems with Two Objectives	113
A.2.2	Further Illustration and Results of the Constr.-Ex Problem	114
A.3	Bus Types and Distributed Slack in Power Flows	115
A.4	Aspects and Interrelations of Applied Objective Functions	116
A.5	SimBench	118
A.6	Statistical Data on Renewable Energy Sources in Germany	121
A.7	Deenergized Lines in Simulation 2 of the Grid Equivalent Comparison Analysis	122
A.8	Number of Elements in Grid Equivalents	124
A.9	Selection of Further Samples in Step 4.c of the Equivalent Function Method	125
	List of Figures	129
	List of Tables	133
	Literature	135
