1	Introduction	1
1.1	Space navigation with clocks	1
1.1.1	Problem	1
1.1.2	Main aim	2
2	Methods	3
2.1	Reference frames	3
2.1.1	Definition of reference frames	3
2.1.2	Examples of reference frames	3
2.1.3	Frames recommended by the IAU	5
2.2	On idealization: criteria	6
2.3	On ideal laws of physics in ideal frames	7
2.3.1	On ideal frames in relativity	9
2.3.1.1	On the principle of relativity	9
2.3.1.2	On the postulation of general covariance	10
2.3.1.3	On the equivalence principle	11
2.3.1.4	On Einstein's principle of locality	12
2.4	Hacking's reality criterion	13
2.5	Concept & definition of adequate frames	13
2.6	Hypothetic deductive method	17
2.7	Organization of the investigation	18
3	Example: one spacecraft in an Earth orbit	21
3.1	Observation with the Space Shuttle	21
3.1.1	Result 1: Irreversability of time dilation	22
3.1.2	Result 2: Reversability of length contraction	24
3.1.3	Result 3: Constant fractional time difference	24
3.2	Prediction based on the PRT and IAU	24
3.2.1	Choice of the reference frame	24
3.2.2	Time dilation and Schwarzschild metric	25
3.2.3	Time elapsed onboard the Space Shuttle	27
3.2.4	Prediction for the ground	29

3.2.5	Prediction for the shuttle	30
3.3	Unique velocity in adequate frames	31
3.4	Criterion for inadequate frames	35
3.5	Variation of the radius of the orbit	35
4	Example: two satellites in an Earth orbit	37
4.1	Time dilation at two satellites	37
4.1.1	Time dilation in an Earth centered frame	39
4.1.2	Time dilation among satellites	40
4.1.3	PRT predicts a time difference among satellites	41
4.1.4	A falsification of a prediction of the PRT	46
4.2	Source of the false prediction of PRT	47
4.3	Interpretation as an idealization	48
4.3.1	Is the covariance postulation an idealization?	48
4.3.2	Is the equivalence principle an idealization?	49
4.3.3	Is the relativity principle an idealization?	51
4.4	Symmetric motion at free fall	52
4.4.1	Rotation symmetry	53
4.4.2	Geometric representation of an atomic clock	56
5	Example: two celestial bodies	59
5.1	Example: Apollo 12 command module	59
5.1.1	Used frame	59
5.1.2	Velocities and time differences	60
5.1.3	Velocities and time differences	61
5.2	Landmarks with zero velocity in a field	61
5.3	Landmark at rest at a local field	70
5.4	Rotating field	72
5.4.1	Observation	72
5.4.2	Separate adequate frames	75
5.4.3	Inadequacy of the rotating field	78
5.4.4	Lagrange point L_1	83
5.5	Earth - Moon system: Basic relations	83
5.5.1	Time Differences at the <u>Ground</u> of Earth	83
5.5.2	Gravitational time difference at the Moon	84
5.5.3	Kinematic time difference at the Moon	85
5.5.4	Spacecraft in the vicinity of Earth	86
6	Example: three celestial bodies	89
6.1	Adequate celestial reference systems	89
6.1.1	Separation of the motion of spacecrafts	89
6.1.2	Separation of the motion of a celestial body	90

6.2	Sun - Earth - Mars	90
6.2.1	Kinematic time difference	90
6.2.2	Gravitational time difference	91
7	Universal reference system	93
8	General solution I	101
8.1	Method: investigation of a paradox	102
8.1.1	Purpose of a paradox	102
8.1.2	On founded results of SR	102
8.1.2.1	Energy momentum relation	102
8.1.2.2	Energy velocity relation	103
8.1.3	On founded results about space or volume in nature .	103
8.1.3.1	Zero rest mass of space or volume in nature	104
8.1.3.2	Global flatness of space and volume in nature	104
8.1.3.3	Global isotropy of the universe	104
8.1.3.4	Global isotropy of space or volume in nature	104
8.1.3.5	Discovery of the nonzero energy density of space	104
8.2	The space paradox	105
8.3	Solution of the space paradox	108
8.4	Change of a VP	110
8.5	Propagation and simulataneous change	112
8.5.1	Derivation of the DEQ of VD	113
8.5.2	Discussion of the DEQ of VD	113
8.6	Gravity and curvature	114
8.6.1	Potential and field	115
8.6.2	Curvature in the vicinity of a mass	117
8.6.3	Discussion of gravity and curvature	120
8.7	Quantum physics	121
8.7.1	VPs imply the GESQ	121
8.7.2	VPs imply the SEQ	122
8.8	Generalization of adequate frames	124
8.8.1	Wave function near two celestial bodies	124
8.8.2	Expectation value of the velocity	125
8.8.3	Prediction for the Earth Moon system	126
8.8.4	Explanation of kinematic time differences	137
9	General solution II	139
9.1	Local formation of volume (in nature), LFV	139
9.2	On the Λ CDM model	144
9.2.1	Observation of the Hubble constant	147

9.2.2	Observed age of the universe	148
9.2.3	Spatial averages in cosmology	150
9.2.3.1	Averages of fluctuations	151
9.3	Energy density of volume	152
9.3.1	Process of formation of volume	154
9.3.2	Derived rate of formation	157
9.3.2.1	Formation of volume by a volume portion	157
9.3.2.2	Formation of volume by one shell	157
9.3.2.3	Light - travel time of one shell	159
9.3.2.4	Integration of the shells	160
9.3.2.5	Amount of formed volume	161
9.4	Time evolution of the Hubble constant	163
9.4.1	Homogeneous density of matter	163
9.4.2	The field of a state of a mode	164
9.4.3	The field of a coherent state	166
9.4.4	GFV and field of $\rho_{m,hom}$	168
9.4.5	Fields caused by volume	169
9.4.6	VPs and field caused by $\rho_{m,hel}$	172
9.4.6.1	Exact derivation	176
10	General solution III	193
10.1	How SR implies quanta	193
10.1.1	Considered example	193
10.1.2	Doppler effect	193
10.1.3	Frame invariance of the Doppler effect	194
10.1.4	Geometric derivation of the Doppler effect	196
10.1.5	Elastic collision	198
10.1.6	System at zero momentum ratio	201
10.1.7	System at nonzero momentum ratio	203
10.1.8	Universal quantization implied by SR	205
10.1.9	Derivation using the Compton effect	206
10.1.10	Consequence for universal quantization	210
10.2	Discussion	211
10.3	Glossary	218
