## Introduction — 1

## Chapter 1

### Basics of numerical methods — 3

- 1.1        Grids and grid functions: introductory concepts — 3
- 1.2        Difference schemes for the boundary value problem of an ordinary differential equation — 5
  - 1.2.1      Finite-difference method — 5
  - 1.2.2      The control volume method — 7
- 1.3        Numerical solution of the Cauchy problem for an ordinary differential equation — 11
  - 1.3.1      Explicit Euler method — 12
  - 1.3.2      Implicit Euler method — 13
  - 1.3.3      Improved explicit Euler method — 13
- 1.4        Numerical methods for a parabolic equation — 14
  - 1.4.1      Explicit difference scheme — 14
  - 1.4.2      Implicit difference scheme — 15
  - 1.4.3      Crank-Nicholson difference scheme — 16
- 1.5        Solution of the Dirichlet problem for the Laplace equation using the grid method — 16

## Chapter 2

### The method of moving nodes for two-point boundary value problems — 18

- 2.1        The concept of a moving node — 18
- 2.2        Obtaining an approximate analytical solution of an ODE with one movable node — 19
  - 2.2.1      The concept of a movable node — 19
  - 2.2.2      Boundary value problem with diffusion — 20
  - 2.2.3      MNM for the convection-diffusion equation — 21
  - 2.2.4      Convection-diffusion equation with a variable coefficient — 22
  - 2.2.5      Flow in a flat pipe — 23
  - 2.2.6      Flow in a round pipe — 25
  - 2.2.7      Heat propagation in a plate — 26
  - 2.2.8      Magnetohydrodynamic Couette flow — 27
- 2.3        Obtaining an analytical solution with several moving nodes — 28
  - 2.3.1      Movable node method for a one-dimensional convection-diffusion problem — 28
  - 2.3.2      Analytical method of control volume for one-dimensional convection-diffusion problem — 32
  - 2.3.3      Increasing the accuracy using Richardson extrapolation — 36

2.4	Obtaining discrete compact schemes for the convective-diffusion problem of the MNM — <b>37</b>
2.4.1	Construction of compact schemes of the convection-diffusion problem based on the FDM — <b>38</b>
2.4.2	Construction of compact schemes of convection-diffusion problem based on finite volume method — <b>40</b>
2.4.3	Construction of schemes using the Richardson extrapolation method — <b>42</b>
2.5	Effect of the choice of the profile on the edge of the control volume on the quality of difference schemes — <b>43</b>
2.6	Improving the circuit using flow equality — <b>47</b>
2.7	Study of the scheme using the MNM — <b>49</b>
2.7.1	Study of monotonicity — <b>49</b>
2.7.2	Calculating the residual — <b>51</b>
2.8	On convergence of MNM — <b>53</b>

### **Chapter 3**

#### **Solution of the Cauchy problem — 55**

3.1	Solution of the Cauchy problem — <b>55</b>
3.1.1	Explicit Euler method — <b>55</b>
3.1.2	Implicit Euler method for a linear equation — <b>56</b>
3.1.3	Implicit Euler method for a nonlinear equation — <b>57</b>
3.1.4	Nonlinear problem — <b>61</b>
3.2	On the convergence of the MNM — <b>63</b>

### **Chapter 4**

#### **Solution of initial-boundary value problems for a parabolic equation — 65**

4.1	Approximate solution of a parabolic equation with one movable node — <b>65</b>
4.2	Examples of problem solutions — <b>67</b>
4.2.1	The first problem — <b>67</b>
4.2.2	Second problem — <b>69</b>
4.2.3	The third problem — <b>70</b>
4.2.4	Unsteady flow of viscous fluid between parallel walls — <b>71</b>
4.2.5	Problem with a boundary condition of the second kind — <b>74</b>
4.3	Approximate solution for the initial boundary value problem of a parabolic equation by the method of lines — <b>75</b>
4.3.1	Approximation with respect to the variable $t$ — <b>76</b>
4.3.2	Approximations by variable $x$ — <b>77</b>
4.4	Nonstationary convection-diffusion equation — <b>81</b>
4.4.1	Approximation of the convection-diffusion equation — <b>82</b>
4.4.2	Test examples — <b>83</b>

- 4.5 Improving the solution of a parabolic equation with multipoint movable nodes — **87**
- 4.5.1 Approximate solution of a parabolic equation based on a multipoint movable node — **87**
- 4.5.2 Numerical experiments — **91**

## **Chapter 5**

### **Solving boundary value problems for elliptic equations — 95**

- 5.1 Solving the Dirichlet problem for two-dimensional boundary value problems by the method of movable nodes — **95**
  - 5.1.1 Test examples — **97**
  - 5.1.2 Flow in an ellipsoidal pipe — **99**
  - 5.1.3 Flow in a rectangular pipe — **100**
  - 5.1.4 Calculating the temperature field in a solid by a movable control volume — **101**
  - 5.1.5 Obtaining a solution for flow in a porous pipe using the moving control volume method — **103**
- 5.2 Solution of the Neumann problem for two-dimensional boundary value problems by the MNM — **106**
  - 5.2.1 Flow in a pipe with a triangular cross section — **107**
  - 5.2.2 Solution of the open flow problem with a rectangular cross section — **109**
  - 5.2.3 Solution of the open flow problem with a trapezoidal cross section — **110**
- 5.3 Improving the approximate solution for boundary value problems — **110**
  - 5.3.1 Obtaining an approximate solution to the problem with approximation with respect to the variable  $x$  — **111**
  - 5.3.2 Obtaining an approximate solution to the problem by approximating the variable  $y$  — **112**
  - 5.3.3 Solution of test problems — **112**
  - 5.3.4 Improving the solution to the problem of flow in a rectangular pipe — **118**
  - 5.3.5 Flow at the inlet section of the pipe — **119**

### **Conclusions — 122**

### **References — 123**

### **Index — 125**
