## CONTENTS

### LECTURE 1

#### **The intersection of nonlinear science, molecular biology, and condensed matter physics. Viewpoints**

by J.A. Krumhansl

|  |   |
|--|---|
| 1. Introduction.....   | 1 |
| 2. Viewpoints .....  | 2 |
| 2.1. Scientific objectives differ intrinsically .....                    | 2 |
| 2.2. Differentiation .....   | 3 |
| 2.3. Biomolecules as polymers are treated realistically these days ..... | 4 |
| 2.4. Models play an important role in Science.....                       | 6 |
| 2.5. Towards more and finer measurements.....                            | 7 |
| 2.6. Some paradigms in current nonlinear science .....                   | 8 |
| 3. Concluding remarks.....   | 9 |

### LECTURE 2

#### **Introduction to solitons and their applications in physics and biology**

by M. Peyrard

|   |    |
|---|----|
| 1. The specificity of nonlinear systems .....                     | 11 |
| 2. The concept of soliton .....                                   | 12 |
| 3. Conditions to have solitons .....                              | 15 |
| 4. The different classes of solitons.....                         | 16 |
| 5. Solitons are everywhere!.....                                  | 18 |
| 6. The formation of solitons: nonlinear energy localization ..... | 21 |
| 7. Conclusion.....  | 24 |

### CHAPTER I

#### **IA, structure and function..... 27**

### LECTURE 3

#### **Selected topics in molecular biology, in need of “hard” science**

by C. Reiss

|  |    |
|--|----|
| 1. DNA Structure .....   | 29 |
| 2. Gene expression.....  | 36 |
| 3. Control and regulation of gene expression: physical aspects ..... | 46 |
| 4. The protein folding problem.....                                  | 50 |
| 5. Conclusion.....   | 54 |

## LECTURE 4

### Modelling the DNA double helix: techniques and results by R. Lavery

|  |    |
|--|----|
| 1. Introduction.....   | 57 |
| 2. Modelling techniques.....                                       | 58 |
| 2.1. Modelling nucleic acids using adapted coordinate systems..... | 60 |
| 2.2. Conformational analysis.....                                  | 62 |
| 3. DNA fine structure.....   | 62 |
| 3.1. Energy surface mapping .....                                  | 65 |
| 3.2. Combinatorial searches.....                                   | 66 |
| 3.3. Building long sequences by superposition .....                | 71 |
| 4. Flexibility and structural transitions.....                     | 72 |
| 4.1. Base pair opening.....  | 72 |
| 4.2. Backbone transitions .....                                    | 75 |
| 4.3. Transitions between allomorphic forms.....                    | 77 |
| 5. DNA dynamics and large scale simulations.....                   | 79 |
| 6. Conclusions .....   | 79 |

## LECTURE 5

### Potential-of-mean-force description of ionic interactions and structural hydration in biomolecular systems

by G. Hummer, D.M. Soumpasis and A.E. García

|  |    |
|--|----|
| 1. Introduction.....   | 83 |
| 2. The statistical-mechanical foundation of the potential-of-mean-force formalism..... | 84 |
| 3. Interactions of nucleic acids with ionic solutions .....                            | 86 |
| 4. A statistical-mechanical theory of biomolecular hydration .....                     | 87 |
| 4.1. Introductory remarks.....   | 87 |
| 4.2. Density expansion in inhomogeneous liquid systems .....                           | 88 |
| 4.3. The water-density profile at the interface of ice and water .....                 | 89 |
| 4.4. Hydration of biological macromolecules: Results for DNA .....                     | 92 |
| 5. Conclusions .....   | 96 |

## LECTURE 6

### Inelastic neutron scattering studies of oriented DNA

by H. Grimm and A. Rupprecht

|  |     |
|--|-----|
| 1. Introduction.....                           | 101 |
| 2. Self correlation .....                      | 103 |
| 2.1. Time-of-flight spectra.....               | 103 |
| 2.2. Scattering function .....                 | 105 |
| 2.3. Eigenvalue density .....                  | 106 |
| 2.4. Analysis of self correlation spectra..... | 107 |

|                               |     |
|-------------------------------|-----|
| 3. Distinct correlation ..... | 110 |
| 4. Central component .....    | 112 |
| 5. Conclusions .....          | 113 |

## LECTURE 7

### Model simulations of base pair motion in B-DNA

by M.A. Collins and F. Zhang

|   |     |
|---|-----|
| 1. Introduction.....                                      | 117 |
| 2. What sort of model? .....                              | 118 |
| 3. The model .....  | 118 |
| 3.1. Model potential surface .....                        | 120 |
| 4. Some dynamical averages of this model DNA motion ..... | 121 |
| 4.1. Hydrogen bond breaking .....                         | 122 |
| 4.2. RMS “atomic” displacements .....                     | 123 |
| 4.3. Large amplitude excitations .....                    | 124 |
| 4.4. Correlations .....                                   | 124 |
| 5. Concluding remarks.....                                | 124 |

## LECTURE 8

### A nonlinear model for DNA melting

by T. Dauxois and M. Peyrard

|  |     |
|--|-----|
| 1. Introduction.....                       | 127 |
| 2. The nonlinear dynamical model .....     | 129 |
| 3. Dynamics of the melting .....           | 130 |
| 4. Formation of denaturation bubbles ..... | 133 |
| 5. Statistical mechanics .....             | 134 |
| 5.1. Melting transition .....              | 134 |
| 5.2. Entropy driven DNA denaturation ..... | 134 |
| 6. Conclusion.....                         | 136 |

## LECTURE 9

### Dynamics of conformational excitations in the DNA macromolecule

by A.M. Kosevich and S.N. Volkov

|  |     |
|--|-----|
| 1. Introduction.....                   | 137 |
| 2. The model constructing .....        | 138 |
| 3. The conformational vibrations ..... | 140 |
| 4. The conformational solitons .....   | 142 |

**LECTURE 10****Nonlinear dynamics of plasmid pBR322 promoters**  
by M. Salerno

|   |     |
|---|-----|
| 1. Introduction.....                      | 147 |
| 2. The model .....                        | 148 |
| 3. Numerical experiment and analysis..... | 149 |
| 4. Conclusions.....                       | 153 |

**LECTURE 11****Helical geometry and DNA models**  
by G. Gaeta

|  |     |
|--|-----|
| 1. Introduction.....                                 | 155 |
| 2. Selection of relevant degrees of freedom.....     | 156 |
| 3. Description of the interactions .....             | 157 |
| 4. DNA hamiltonians .....                            | 159 |
| 5. DNA dynamics .....                                | 160 |
| 6. Dispersion relations, and breather solutions..... | 160 |
| 7. Soliton solutions.....                            | 161 |
| 8. Ising model approach.....                         | 162 |
| 9. Conclusions.....                                  | 163 |

**LECTURE 12****Nonlinear localized excitations and the dynamics of H-bonds in DNA**  
by S. Flach and C.R. Willis

|  |     |
|--|-----|
| 1. Introduction.....                               | 165 |
| 2. H-bond dynamics.....                            | 166 |
| 2.1. Model classes.....                            | 166 |
| 2.2. Nonlinear localized excitations .....         | 167 |
| 3. Functioning with NLEs - phonon scattering ..... | 169 |

## CHAPTER II

### Proteins, conformation and dynamics.... 175

#### LECTURE 13

##### Proteins and the physics of complexity

by H. Frauenfelder

|   |     |
|---|-----|
| 1. Proteins .....   | 177 |
| 2. The approach .....   | 179 |
| 3. The structure of proteins .....                                | 179 |
| 4. The energy landscape .....                                     | 180 |
| 4.1. The experimental evidence for conformational substates ..... | 181 |
| 4.1.1. Ligand binding to myoglobin .....                          | 181 |
| 4.1.2. Spectroscopic hole burning .....                           | 184 |
| 4.2. The hierarchy of conformational substates .....              | 184 |
| 4.2.1. Taxonomic conformational substates .....                   | 185 |
| 4.2.2. Statistical substates .....                                | 185 |
| 4.3. Conformational excitations .....                             | 186 |
| 4.4. Theoretical and computational studies .....                  | 186 |
| 5. Some remarks .....   | 186 |

#### LECTURE 14

##### Multi-basin dynamics of a protein in aqueous solution

by A.E. García

|  |     |
|--|-----|
| 1. Introduction .....                                    | 191 |
| 2. Description of the system .....                       | 192 |
| 3. Results and discussion .....                          | 193 |
| 3.1. Localized non-linear motions .....                  | 193 |
| 3.2. Delocalized non-linear motions .....                | 196 |
| 3.2.1. Tree analysis .....                               | 197 |
| 3.3. Molecule optimal dynamical coordinates (MODC) ..... | 199 |
| 4. Conclusions .....                                     | 206 |

#### LECTURE 15

##### Nonlinear excitations in molecular crystals with chains of peptide bonds

by M. Barthes

|                                      |     |
|--------------------------------------|-----|
| 1. Introduction .....                | 209 |
| 2. Acetanilide and derivatives ..... | 209 |
| 2.1. Infrared results .....          | 211 |

|   |     |
|---|-----|
| 2.2. Raman scattering.....                      | 213 |
| 2.3. Low temperature neutron diffraction .....  | 213 |
| 2.4. Discussion.....                            | 215 |
| 3. N-methylacetamide .....                      | 215 |
| 4. L-alanine and polyalanines .....             | 219 |
| 5. Nucleotides, polypeptides and proteins ..... | 219 |
| 6. Conclusion.....                              | 220 |

## LECTURE 16

### Low temperature Raman spectra of acetanilide and its deuterated derivatives: comparison with normal mode analysis

by G. De Nunzio

|   |     |
|---|-----|
| 1. Introduction.....                              | 223 |
| 1.1. Bioenergetics .....                          | 223 |
| 1.1.1. Davydov's soliton.....                     | 224 |
| 1.2. Where ACN comes in.....                      | 224 |
| 1.3. Optical anomalies in ACN .....               | 225 |
| 1.4. Theories and experiments .....               | 225 |
| 2. Normal mode analysis.....                      | 226 |
| 2.1. The program CHARMM.....                      | 226 |
| 2.2. Results .....                                | 227 |
| 2.2.1. The range 1400-1700 cm <sup>-1</sup> ..... | 227 |
| 2.2.2. Some other frequency range.....            | 230 |

## LECTURE 17

### Conformational dynamics of proteins: beyond the nanosecond time scale

by H. Grubmüller, N. Ehrenhofer and P. Tavan

|  |     |
|--|-----|
| 1. Introduction.....   | 231 |
| 2. A simplified protein model .....                                  | 232 |
| 3. Configurational space and conformational substates .....          | 233 |
| 4. Conformational coordinates from neural clustering.....            | 235 |
| 5. Conformational coordinates from principal component analysis..... | 237 |
| 6. Summary and conclusion .....                                      | 239 |

## LECTURE 18

### Motions and correlations of the transmembrane domain of a protein receptor studied by molecular dynamics simulation

by N. Garnier, D. Genest and M. Genest

|   |     |
|---|-----|
| 1. Introduction.....                          | 241 |
| 2. Materials and methods.....                 | 241 |
| 2.1. Molecular dynamics simulation.....       | 241 |
| 2.2. Correlations .....                       | 242 |
| 2.3. Propagation of a local perturbation..... | 242 |
| 3. Results.....                               | 243 |
| 4. Discussion and conclusion .....            | 246 |

## CHAPTER III

### Energy and charge transport..... 247

## LECTURE 19

### Solitary waves in biology

by A.C. Scott

|  |     |
|--|-----|
| 1. Introduction.....                     | 249 |
| 2. The nerve impulse.....                | 250 |
| 2.1. Linear and nonlinear diffusion..... | 250 |
| 2.2. The Hodgkin-Huxley equations .....  | 250 |
| 3. Solitons in protein.....              | 254 |
| 3.1. Polarons and conformons .....       | 254 |
| 3.2. Vibrational energy transport .....  | 255 |
| 3.3. Quantum theory .....                | 257 |
| 3.4. Thermal effects.....                | 258 |
| 3.5. Crystalline acetanilide.....        | 260 |
| 3.6. Transport of electronic charge..... | 261 |
| 3.7. Protonic solitons .....             | 262 |
| 3.8. Biological applications.....        | 262 |
| 4. Conclusions .....                     | 265 |

## LECTURE 20

### Exact two-quantum states of the semiclassical Davydov model and their thermal stability

by L. Cruzeiro-Hansson and V.M. Kenkre

|                           |     |
|---------------------------|-----|
| 1. Introduction.....      | 269 |
| 2. The Davydov model..... | 270 |

|   |     |
|---|-----|
| 3. Two-quantum states and their thermal stability ..... | 271 |
| 4. General remarks .....                                | 274 |

## LECTURE 21

### Post-soliton quantum mechanics

by D.W. Brown

|  |     |
|--|-----|
| The inverse problem .....                  | 280 |
| General properties of Wannier states ..... | 281 |
| Weak coupling limits .....                 | 283 |
| Conclusion .....                           | 286 |

## LECTURE 22

### Dynamic form factor for the Yomosa model for the energy transport in proteins

by A. Neuper and F.G. Mertens

|   |     |
|---|-----|
| 1. Solitons in muscle fibers .....        | 287 |
| 2. Form factors in the Toda lattice ..... | 287 |
| 2.1. Simulation results .....             | 289 |
| 2.2. Cnoidal-wave approach .....          | 290 |
| 2.3. The soliton limit .....              | 292 |
| 3. Summary .....                          | 293 |

## LECTURE 23

### Energy and charge transfer in photosynthesis

by W. Mäntele

|   |     |
|---|-----|
| 1. Introduction. Photosynthesis: a physico-chemo-biologist's view .....   | 295 |
| 2. The lipid bilayer membrane as a structural basis .....   | 296 |
| 3. Pigments used for light absorption in photosynthesis .....   | 298 |
| 4. Pigments and proteins form pigment-protein-complexes .....   | 300 |
| 5. Antenna systems of plants and bacteria .....   | 302 |
| 6. From antennae to reaction centers: converting and stabilizing light energy .....                                   | 304 |
| 7. Information on structure and composition of reaction centers .....   | 306 |
| 8. Characteristics of a "quinone type" reaction center .....  | 307 |
| 9. Primary processes, forward, and reverse electron transfer and the corresponding rates in the reaction center ..... | 308 |
| 10. Why do reaction centers use quinones as electron acceptors? .....   | 310 |
| 11. What is the molecular basis for external reorganization energy in the reaction center? ..                         | 312 |
| 12. Concluding remarks .....  | 314 |

## LECTURE 24

### The role of nonlinearity in modelling energy transfer in Scheibe aggregates by O. Bang, P.L. Christiansen, K.Ø. Rasmussen and Y.B. Gaididei

|   |     |
|---|-----|
| 1. Introduction .....   | 317 |
| 2. Scheibe aggregates .....   | 318 |
| 2.1. Langmuir-Blodgett films and Scheibe aggregates .....                       | 318 |
| 2.2. Experiments on Langmuir-Blodgett Scheibe aggregates .....                  | 319 |
| 2.3. Applications, and the connection with photosynthesis .....                 | 321 |
| 2.4. Physical models .....  | 324 |
| 3. The nonlinear model .....  | 325 |
| 3.1. Derivation .....   | 325 |
| 3.2. Parameter values for a monolayer oxacyanine LB Scheibe aggregate .....     | 327 |
| 3.3. Approximations of the colored noise .....                                  | 329 |
| 3.4. Choosing the initial condition .....                                       | 330 |
| 3.5. Nonlinear coherence time for the ground state solitary wave solution ..... | 331 |
| 3.6. The role of collapse .....   | 333 |
| 4. Conclusion .....   | 335 |

## LECTURE 25

### Protons in hydrated protein powders

by G. Careri, F. Bruni and G. Consolini

|   |     |
|---|-----|
| 1. Abstract .....   | 337 |
| 2. Proton percolation and emergence of biological function in nearly dry biosystems .....                 | 338 |
| 3. Likely detection of protonic polarons in percolative water clusters adsorbed on lysozyme powders ..... | 341 |

## LECTURE 26

### Nonlinear models of collective proton transport in hydrogen-bonded systems

by M. Peyrard

|  |     |
|--|-----|
| 1. Introduction .....                                      | 349 |
| 2. The physical problem and the first answers .....        | 350 |
| 3. The A-D-Z soliton model for proton transport .....      | 351 |
| 4. Is there an experimental evidence of the soliton? ..... | 354 |
| 5. Conclusion .....  | 359 |

**LECTURE 27****Proton-solitons bridge physics with biology**

by G.P. Tsironis

|   |     |
|---|-----|
| 1. Introduction.....                                      | 361 |
| 2. Proton-soliton mobility .....                          | 363 |
| 3. Quantum tunnelling.....                                | 364 |
| 4. Conclusions .....                                      | 365 |
| Appendix. Calculation of the classical soliton mass ..... | 365 |
| Semiclassical correction.....                             | 366 |

**LECTURE 28****Neutron scattering studies of biopolymer-water systems: solvent mobility and collective excitations**

by H.D. Middendorf

|  |     |
|--|-----|
| 1. Introduction.....   | 369 |
| 2. Basic relations and scattering properties.....                                      | 370 |
| 3. Globular proteins at low hydration .....  | 372 |
| 3.1. Hydration dynamics of phycocyanin in the sorption regime .....                    | 372 |
| 3.2. High-resolution quasi-elastic scattering, $h\omega < 100 \mu\text{eV}$ .....      | 373 |
| 3.3. Quasi-elastic and inelastic scattering with $h\omega \geq 100 \mu\text{eV}$ ..... | 376 |
| 4. Highly hydrated systems: polymer and biopolymer gels .....                          | 377 |
| 4.1. Structure and dynamics of aqueous gels.....                                       | 377 |
| 4.2. Quasi-elastic scattering.....   | 378 |
| 4.3. Inelastic scattering.....   | 380 |
| 5. Conclusions .....   | 381 |

**CHAPTER IV****Beyond biological molecules..... 385****LECTURE 29****The cell's microtubules: self-organization and information processing properties**

by J.A. Tuszynski, B. Trpisová, D. Sept, M.V. Sataric and S. Hameroff

|  |     |
|--|-----|
| 1. Background information .....              | 387 |
| 2. Assembly/disassembly modelling .....      | 389 |
| 3. The dipolar lattice and its phases.....   | 390 |
| 4. Dynamics in the ferroelectric phase ..... | 393 |

|  |     |
|--|-----|
| 5. Stability of the spin-glass phase.....      | 398 |
| 6. Information capacity in various phases..... | 400 |
| 7. Summary.....                                | 403 |

## LECTURE 30

### **Translation optimization in bacteria: statistical models**

by F. Bagnoli, G. Guasti and P. Liò

|                                |     |
|--------------------------------|-----|
| 1. Introduction.....           | 405 |
| 2. A dynamical model .....     | 406 |
| 3. Statistical mechanics ..... | 408 |
| 4. Concluding remarks .....    | 410 |

## LECTURE 31

### **Dynamics of vibrational dissociation of a pseudo-cluster**

by D. Hennig and H. Gabriel

|                                |     |
|--------------------------------|-----|
| 1. Introduction.....           | 413 |
| 2. The model hamiltonian.....  | 413 |
| 3. Dynamics of the model ..... | 415 |
| 3.1. Whisker map .....         | 415 |
| 3.2. Resonance overlap .....   | 416 |

## LECTURE 32

### **The step-potential model for $\pi$ -electrons in hydrocarbon-systems**

by C. Kuhn

|   |     |
|---|-----|
| 1. Introduction.....                                  | 421 |
| 2. Non-linear optics .....                            | 423 |
| 3. Kinks in polyacetylene: statics and dynamics ..... | 423 |
| 4. The $C_{60}$ molecule .....                        | 425 |

## CONCLUSION..... 427
