Preface — v

Clemens Posten

1 Introduction – Discovering Microalgae as Source for Sustainable Biomass — 1

- 1.1 All life emanates from the sun! All life originates from the sea! — 1
- 1.2 Sustainable microalgal biomass of the third generation — 3
 - 1.2.1 Microalgae produce 5 times more biomass per hectare than terrestrial crops — 3
 - 1.2.2 Microalgae can be cultivated in arid areas which are not suitable for agriculture — 4
 - 1.2.3 Microalgae exhibit high lipid contents over 50 % and high titers of other products — 4
- 1.3 The technical challenge — 4
 - 1.3.1 Microalgae can use CO₂ and sunlight — 4
 - 1.3.2 Microalgae can deliver cheap sustainable biomass for bulk chemicals and biofuels — 5
 - 1.3.3 Microalgae can be produced nearly everywhere — 5
 - 1.3.4 Microalgae do not need pesticides and only little fertilizers — 6
 - 1.3.5 Closed photobioreactors as tools of choice — 7

The biological potential of microalgae

Thomas Friedl, Nataliya Rybalka and Anastasiia Kryvenda

2 Phylogeny and systematics of microalgae: An overview — 11

- 2.1 Introduction — 11
- 2.2 Diversity and evolution of microalgae — 16
 - 2.2.1 Algal diversity — 16
 - 2.2.2 Algal evolution — 17
- 2.3 Cyanobacteria: The prokaryotic algae — 19
- 2.4 Plantae or Archaeplastida supergroup: Green algae, red algae and glaucophytes — 22
 - 2.4.1 Viridiplantae: The green algae distributed over two phyla — 22
 - 2.4.2 Rhodophyta: Red algae — 25
 - 2.4.3 Glaucophytes — 26
- 2.5 Chromalveolate algae: The photosynthetic Stramenopiles (heterokont algae) — 26
 - 2.5.1 Diatoms (Bacillariophyta; photosynthetic Stramenopiles) — 27
 - 2.5.2 Eustigmatophyceae and Xanthophyceae (photosynthetic Stramenopiles) — 29
 - 2.5.3 Other photosynthetic Stramenopiles — 30

- 2.5.3.1 Raphidophyceae — 30
- 2.5.3.2 Synurophyceae and Chrysophyceae — 30
- 2.5.3.3 Phaeophyceae — 31
- 2.6 Chromalveolate algae: coccolithophorids and haptophyte algae — 31
- 2.7 Chromalveolate algae: Dinoflagellates (Dinophyta) — 32
- 2.8 Euglenoids (Excavata supergroup) — 33
- Acknowledgements — 33
- References — 34

Christian Wilhelm and Torsten Jakob

- 3 Balancing the conversion efficiency from photon to biomass — 39**
 - 3.1 Introduction — 39
 - 3.2 Definition of important terms — 40
 - 3.2.1 Photosynthetic efficiency — 40
 - 3.2.2 Growth efficiency (photon to biomass efficiency) — 41
 - 3.3 Physiological dynamics of processes which control biological energy conversion efficiency — 45
 - 3.3.1 Absorption — 45
 - 3.3.2 Regulation and efficiency of photochemistry — 46
 - 3.3.3 Regulation of electron flow — 47
 - 3.3.4 Regulation of carbon allocation — 48
 - 3.4 Conclusions for microalgal biotechnology — 50
 - References — 51

Thomas Brück and Daniel Garbe

- 4 Algae symbiosis with eukaryotic partners — 55**
 - 4.1 Introduction to algae-specific symbiosis — 55
 - 4.1.1 Importance of algae symbiotic relationships — 55
 - 4.1.2 Modes of algae symbiosis with eukaryotes — 56
 - 4.2 Aquatic systems — 58
 - 4.2.1 Algae symbiosis with Cnidaria — 58
 - 4.2.1.1 Symbiont uptake and management — 60
 - 4.2.1.2 Flux of primary metabolites in host and symbiont — 60
 - 4.2.1.3 Optimizing photosynthesis for efficient metabolite exchange — 61
 - 4.2.1.4 Symbiont-derived secondary metabolites — 61
 - 4.2.1.5 Effects of environmental stress on symbiosis — 62
 - 4.2.2 Algae symbiosis with Porifera — 62
 - 4.2.2.1 Morphology of sponge–algae associations — 63
 - 4.2.2.2 Symbiont uptake, specificity and transmission — 64
 - 4.2.2.3 Flux of primary metabolites in host and symbiont — 64
 - 4.2.2.4 Symbiont-derived secondary metabolites — 65

4.2.2.5	Effects of environmental stress on symbiosis —	65
4.2.3	Algae symbiosis with Mollusca —	66
4.2.3.1	Morphology of mollusc–algae associations —	66
4.2.3.2	Symbiont uptake and maintenance —	67
4.2.3.3	Flux of primary metabolites in host and symbiont —	68
4.3	Terrestrial system —	68
4.3.1	Lichens: Ecological pioneers —	68
4.3.2	Modes of lichen symbiosis —	69
4.3.3	Lichen taxonomy and evolution —	69
4.3.4	Lichen morphology —	70
4.3.5	Symbiotic interactions —	71
4.3.6	Lichen growth and propagation —	72
4.3.6.1	Lichen propagation —	73
4.3.7	Symbiotic benefits for algal photobionts —	73
4.3.8	Biotechnological aspects of lichen/mycobiont cultivation —	76
4.3.9	Potential of bioactive lichen-derived metabolites —	77
	References —	79

Anna Kirchmayr and Christoph Griesbeck

5	Genetic engineering, methods and targets —	87
5.1	Introduction —	87
5.2	Methods in genetic engineering of eukaryotic microalgae —	87
5.2.1	Transformation —	87
5.2.1.1	Glass beads and silicon whiskers —	87
5.2.1.2	Particle bombardment —	88
5.2.1.3	Electroporation —	88
5.2.1.4	Agrobacterium tumefaciens-mediated transformation —	88
5.2.2	Promoters —	89
5.2.3	Gene silencing —	91
5.2.4	Codon usage —	91
5.2.5	Improvement of expression rates and secretion of proteins —	91
5.2.6	Selection markers —	93
5.2.7	Reporter genes —	94
5.3	Examples for biotechnological relevant proteins —	96
5.3.1	Proteins expressed in <i>Chlamydomonas reinhardtii</i> —	96
5.3.2	Recombinant proteins in other microalgae —	98
5.4	Future prospects/outlook —	98
5.4.1	Methods for genetic engineering —	98
5.4.2	Products from genetically modified microalgae —	99
	Acknowledgements —	100
	References —	100

Jean-Paul Cadoret, Alexandre Lejeune, Rémy Michel and Aude Carlier

- 6 Algenics: Providing microalgal technologies for biological drugs — 107**
- 6.1 Background and inception of the company — 107
- 6.2 Development and optimization of proprietary technologies — 108
- 6.3 From proofs of concept to therapeutic product candidates — 109
- References — 109

Technical Means for Algae Production

Yusuf Chisti

- 7 Raceways-based production of algal crude oil — 113**
- 7.1 Introduction — 113
- 7.2 Raceways — 114
- 7.2.1 General configuration — 114
- 7.2.2 Flow in a raceway — 115
- 7.2.3 Power consumption for mixing — 118
- 7.2.4 Paddlewheel design — 120
- 7.2.5 Location — 121
- 7.2.6 Evaporation from raceways — 121
- 7.2.7 Temperature variations — 122
- 7.2.8 Culture pH and carbon dioxide demand — 124
- 7.2.9 Oxygen removal — 125
- 7.2.10 Potential for contamination — 126
- 7.2.11 Irradiance variation with depth — 126
- 7.2.12 Local and average values of specific growth rate — 128
- 7.2.13 Raceway capital cost — 129
- 7.3 Algal crude oil as replacement petroleum — 130
- 7.4 Algae biomass production — 131
- 7.4.1 Productivity of biomass and oil — 132
- 7.4.2 Limits to algal biomass productivity — 134
- 7.4.2.1 Photosynthetic efficiency — 135
- 7.4.2.2 Why are microalgae more efficient than terrestrial plants? — 136
- 7.5 Economics of algal crude oil — 137
- 7.5.1 Residual biomass — 139
- 7.6 Concluding remarks — 141
- 7.7 Nomenclature — 142
- References — 144

Jeff Obbard

- 8 Cellana LLC: Algae-based products for a sustainable future — 147**
- 8.1 Introduction — 147
- 8.2 Cellana technology and demonstration facility — 147
- 8.3 Biorefinery approach — 148

8.4	Prospects — 150
	References — 150

9	Principles of photobioreactor design — 151
9.1	Introduction — 151
9.2	Major factors governing the production of microalgae — 151
9.3	Open systems — 153
9.3.1	Open raceways — 153
9.3.1.1	Technical issues — 155
9.3.1.2	Scale-up — 157
9.3.1.3	Drawbacks — 159
9.4	Enclosed photobioreactors — 159
9.4.1	Flat-panel photobioreactors — 159
9.4.1.1	Technical issues — 161
9.4.1.2	Scale-up — 166
9.4.1.3	Drawbacks — 166
9.4.2	Tubular photobioreactors — 167
9.4.2.1	Technical issues — 168
9.4.2.2	Scale-up — 174
9.5	Summary of major characteristics of large-scale algal cultures systems — 177
	Acknowledgements — 178
	References — 178

10	Knowledge models for the engineering and optimization of photobioreactors — 181
10.1	Introduction — 181
10.2	Theoretical background for radiation measurement and handling — 181
10.2.1	Main physical variables — 181
10.2.2	Solar illumination — 184
10.3	Modeling light-limited photosynthetic growth in photobioreactors — 184
10.3.1	Overview of the modeling approach — 184
10.3.2	Mass balances — 186
10.3.3	Stoichiometry of photosynthetic growth — 187
10.3.3.1	Simple stoichiometric equations — 187
10.3.3.2	Structured stoichiometric equations — 188
10.3.4	Kinetic modeling of photosynthetic growth — 189
10.3.5	Energetics of photobioreactors — 192

10.3.6	Radiative transfer modeling —	194
10.3.6.1	Radiative transfer equation —	195
10.3.6.2	Optical and radiative properties for micro-organisms —	201
10.4	Illustrations of the utility of modeling for the understanding and optimization of cultivation systems —	203
10.4.1	Understanding the role of light-attenuation conditions —	203
10.4.1.1	Illuminated fraction γ —	203
10.4.1.2	Achieving maximal productivities with appropriate definition of light-attenuation conditions —	204
10.4.1.3	Prediction of biomass concentration and productivity —	206
10.4.1.4	Engineering formula for assessment of maximum kinetic performance in PBRs —	210
10.4.2	Solar production —	211
10.4.2.1	Prediction of PBR productivity as a function of radiation conditions —	211
10.4.2.2	Engineering formula for maximal productivity determination —	214
10.4.3	Modeling light/dark cycle effects —	214
10.5	Acknowledgments —	217
10.6	Nomenclature —	217
	References —	220
