1	Introduction	1
1.1	Motivation for the Trapping and Study of Antihydrogen	1
1.1.1	Precision Comparison of the Properties of Hydrogen and Antihydrogen	2
1.1.2	Gravitational Interaction Between Matter and Antimatter	3
1.2	Short Review of Antimatter Studies and Antihydrogen Experiments	3
1.3	Dissertation Overview	6
1.4	Contributions of the Author	6
	References	7
2	Theory	9
2.1	Formation of Antihydrogen with Trapped Plasmas	9
2.1.1	Three-Body Recombination	12
2.2	Charged (Anti)Particle and Neutral-Atom Trapping	13
2.2.1	Penning-Malmberg Trap for Charged Particles	13
2.2.2	Neutral-Atom Trapping	19
2.3	Particle-Antiparticle Annihilation	21
2.3.1	Electron-Positron Annihilation	22
2.3.2	Antiproton Annihilation	23
2.4	Semiconductor Detectors	24
2.4.1	Double-Sided Silicon Microstrip Detectors	25
2.5	Summary	25
	References	26
3	The ALPHA Apparatus and Procedures	29
3.1	Infrastructure Overview	29
3.2	Diagnostic and Particle Detection Devices	31
3.2.1	Charged Particle Temperature Measurement	33

3.3	Production and Accumulation of Antiparticles	34
3.3.1	Antiproton Decelerator (AD)	34
3.3.2	Positron Accumulator	37
3.4	Charged Particle Manipulation and Trapping	39
3.4.1	Penning-Malmberg Trap	39
3.4.2	Catching and Cooling of Antiprotons	39
3.4.3	Rotating Wall Compression and Electron Kick-Out.	45
3.4.4	Evaporative Cooling	48
3.4.5	Autoresonant Mixing	51
3.5	Magnetic Neutral-Atom Trap	53
3.5.1	Axial Magnetic Field	53
3.5.2	Radial Magnetic Field	54
3.5.3	Fast Shutdown	56
3.6	Trapping Experiment Overview.	57
3.7	Summary	59
	References	60
4	The ALPHA Silicon Detector	61
4.1	Detector Hardware and Software for Control and Data Collection	62
4.1.1	Silicon Detector Modules	62
4.1.2	VAITA ASIC Readout Chips	64
4.1.3	Detector Configuration	65
4.1.4	Readout Chain	66
4.1.5	TA and Readout Triggers	67
4.1.6	Analog Readout	70
4.1.7	Summary of Detector Hardware	78
4.2	Monte Carlo Simulation	79
4.2.1	Overview	79
4.2.2	Materials and Geometry	80
4.2.3	Event Generation	81
4.2.4	Digitization	84
4.3	Summary	86
	References	87
5	Event Reconstruction in the ALPHA Detector	89
5.1	Challenges for the ALPHA Event Reconstruction	89
5.2	Overview of the Event Reconstruction	92
5.3	Enumeration and Filtering of Track Candidates	92
5.4	Determining the Helix Parameters	98
5.4.1	Helix Parametrization	98
5.4.2	Radial Helix Parameters	98
5.4.3	Axial Helix Parameters	100
5.5	Track Pruning	101

5.6	Vertexing	104
5.6.1	Closest Approach Between Two Helices	105
5.6.2	Closest Approach Between $N_{\text{tracks}} > 2$ Helices	105
5.6.3	Mean Distance of Closest Approach to the Vertex	106
5.6.4	Track Exclusion	107
5.7	Vertex Distributions	108
5.7.1	Annihilation on Background Gas	108
5.7.2	Octupole-Induced Antiproton Annihilation	109
5.7.3	Antihydrogen Formation in the Neutral-Atom Trap Field	112
5.7.4	Reconstructed Vertex Position Resolution	113
5.8	Summary	118
	References	118
6	Rejection of Background Events	121
6.1	Backgrounds to the Antihydrogen Annihilation Signal	121
6.1.1	Environment and Hardware Background	122
6.1.2	Mirror-Trapped Antiprotons	124
6.1.3	Cosmic Rays	125
6.2	Importance of Background Rejection	126
6.2.1	Blind Analysis	127
6.3	Cosmic Background Rejection	127
6.3.1	Discriminating Variables	128
6.3.2	‘Training’ Datasets	130
6.3.3	Cut Placement and Optimization	130
6.3.4	Results of the Background Rejection	132
6.4	Summary	133
	References	134
7	The Trapping of Antihydrogen	135
7.1	Mirror-Trapped Antiprotons	135
7.2	Simulation of Particle Trajectories During Magnetic Trap Shutdown	138
7.3	Control Measurements	139
7.3.1	Neutral Trap Magnets Disengaged	139
7.3.2	Without Antiprotons and/or Positrons	140
7.3.3	Electric Potential Biasing During Fast Magnetic Shutdown	140
7.3.4	Heated Positrons	141
7.4	Initial Search for Trapped Antihydrogen (2009)	142
7.5	Observation of Trapped Antihydrogen (2010)	146
7.6	Summary	149
	References	149

8	Future Prospects and Conclusion	151
8.1	Recent Measurement: Long-Time Confinement of Antihydrogen	151
8.2	Upcoming Measurement: Microwave Spectroscopy	152
8.3	Future Measurement: New Apparatus and Laser Spectroscopy	154
8.4	Conclusion	154
