

Contents

1	Introduction	1
1.1	Overview	2
1.2	Why Vehicular Communication?	2
1.3	Architecture Layers	3
	References	4
2	Applications of Vehicular Communication	5
2.1	Safety	6
2.1.1	Critical Traffic Situations	9
2.1.2	Classification of Safety Applications	17
2.1.3	Normal Transmission Scheme	20
2.1.4	Bidirectional Transmission Scheme	22
2.1.5	Non-autonomous Systems	23
2.1.6	Quick Warning Alerts	25
2.2	Resource Efficiency	30
2.2.1	Autonomous Systems	31
2.2.2	Normal Traffic Alerts	31
2.3	Infotainment	33
2.3.1	Ad Hoc Services	34
2.3.2	Provider Services	35
2.4	Summary of Application Requirements	35
	References	38
3	Communication Regimes	39
3.1	Bidirectional Communication Regime	40
3.2	Position Based Communication Regime	42
3.3	Multi-Hop Position Based Communication Regime	44
	References	45
4	Information in the Vehicular Network	47
4.1	Accuracy of Information	48
4.2	Time Critical Information	49
4.3	Time and Distance for Braking	49
4.4	Time and Distance for Overtaking	56

4.5	Time Zones for Proactive Applications	58
4.5.1	Data Requirements	58
4.5.2	Network Requirements	60
4.5.3	The Cooperative Collision Avoidance System	61
	References	65
5	Routing	67
5.1	Multi-hop Routing Protocols	69
5.1.1	Ad Hoc on Demand Distance Vector (AODV)	69
5.1.2	Grid Location Service (GLS)	71
5.1.3	Greedy Perimeter Stateless Routing (GPSR)	74
5.1.4	Geographic Source Routing (GSR)	75
5.1.5	Contention-Based Forwarding (CBF)	76
5.1.6	Octopus	80
5.1.7	Advanced Greedy Forwarding (AGF)	81
5.1.8	Preferred Group Broadcasting (PGB)	81
5.2	Secure Multi-hop Routing	84
5.2.1	Authenticated Routing for Ad Hoc Networks (ARAN)	84
5.2.2	Secure Ad Hoc on Demand Vector (SAODV)	85
5.2.3	Secure Link State Routing Protocol (SLSP)	86
5.2.4	Secure Position Aided Ad Hoc Routing (SPAAR)	86
	References	87
6	Medium Access for Vehicular Communications	89
	References	96
7	Physical Layer Technologies	99
	References	102
8	Security	103
	References	106
