Preface XIII

1	Introduction	1
1.1	Galaxy Formation	4
1.2	Decoding the Fossil Records: Photometric and Spectroscopic Diagnostics	6
1.3	Decoding the Fossil Record: the Tools	8
1.3.1	Theoretical Stellar Models, Tracks, Isochrones	8
1.3.2	Luminosity Functions, Synthetic CMDs	15
1.3.3	Stellar Population Synthesis Models	17
2	Low-Mass Star Physics	19
2.1	Basic Equations	19
2.2	The Thermodynamical Properties of Low-Mass Stars	30
2.2.1	Coulomb Interactions	34
2.2.2	The Exchange Correction	36
2.2.3	The Formation of Molecules	36
2.2.4	Turbulent Pressure	39
2.3	Nuclear Energy Production and Nucleosynthesis	40
2.3.1	Hydrogen Burning	42
2.3.1.1	The p - p Chain	42
2.3.1.2	The CNO Bi-cycle	43
2.3.1.3	High-Temperature Proton Captures	45
2.3.2	Helium Burning	47
2.4	Radiative and Conductive Opacity	49
2.4.1	Radiative Opacity for C-enhanced Mixtures	53
2.4.2	The H_2 Collision Induced Absorption	54
2.4.3	Conductive Opacity	55
2.5	The Atmospheric Structure	58
2.6	Mass Loss	61
2.6.1	The Red Giant Branch Stage	62
2.6.2	The Horizontal Branch Stage	63
2.6.3	The Asymptotic Giant Branch Stage	64
2.7	Diffusion Processes	65

2.7.1	Atomic Diffusion	66
2.7.2	Radiative Levitation	69
2.8	Rotation	71
2.9	Internal Gravity Waves	75
2.10	Magnetic Fields	77
2.11	Thermohaline Mixing	78
3	From the Main Sequence to the Tip of the Red Giant Branch	83
3.1	Overview	83
3.2	Very Low-Mass Stars	84
3.2.1	The Physical Properties	84
3.2.2	Structure and Evolution	88
3.2.3	The Colour–Magnitude and the Mass–Luminosity Diagrams	91
3.2.4	The Mass–Radius Relation	94
3.3	The Main Sequence	94
3.3.1	Low Main Sequence Stellar Models	95
3.3.2	Upper Main Sequence Stellar Models	98
3.4	The Standard Solar Model	103
3.4.1	The Helioseismic Constraints	104
3.4.2	Standard Solar Models and the Solar Neutrino Problem: a Solved Conundrum	106
3.4.3	<i>Non-standard</i> Solar Models	107
3.4.4	The Metallicity of the Sun and the “Solar Abundance Problem”	109
3.5	Blue Stragglers	110
3.5.1	Formation Channels	112
3.5.2	Specific Frequency and Radial Distribution	117
3.5.3	Pulsating Blue Stragglers: SX Phoenixis Stars	120
3.6	Subgiant Branch Evolution	121
3.7	Red Giant Branch Evolution	123
3.7.1	The Red Giant Branch Transition	129
3.8	The Helium Flash	130
3.8.1	3D-Simulations of the Helium Flash	132
3.9	Theoretical Isochrones for the Hydrogen Burning Stages	134
3.9.1	The Effect of Chemical Composition	136
3.9.1.1	The Heavy Element Mixture	137
3.9.1.2	The Helium Content	141
3.9.2	The Luminosity Function	143
3.9.2.1	The Shape of the Luminosity Function	144
3.9.2.2	The Dependence of the Luminosity Function on the Stellar Population Properties	145
3.9.3	The Calibration of Superadiabatic Convection	146
3.9.3.1	The Mixing Length Flavour	148
3.9.4	The RGB Luminosity Function Bump	151
3.9.5	The Tip of the Red Giant Branch	154
3.9.6	The Effect of Atomic Diffusion and Rotation	156

4	Horizontal Branch and Red Clump	163
4.1	Overview	163
4.2	Mixing Processes	164
4.2.1	The Physical Conditions in the Convective Core	164
4.2.2	The Expansion of the Convective Core	165
4.2.3	Induced Semi-convection	166
4.2.4	The Breathing Pulses	168
4.3	The Horizontal Branch Evolution	169
4.3.1	The Morphology of the HB Evolutionary Tracks	174
4.3.2	The Core He-burning Lifetime	176
4.3.3	Synthetic Horizontal Branches	177
4.3.4	The Second Parameter Problem	180
4.4	Extremely Hot Horizontal Branch and “Blue Hook” Stars	183
4.5	Low-Mass Pulsating Stars in the Core He-burning Stage	189
4.5.1	RR Lyrae Stars	191
4.5.1.1	The Instability Strip	192
4.5.1.2	The Pulsational-Period Relation $P = f(M, L, T_{\text{eff}})$	193
4.5.1.3	The Oosterhoff Dichotomy	194
4.5.1.4	The Rate of Pulsational-Period Change	195
4.5.2	Population II Cepheids	196
4.5.2.1	The Evolutionary Status of Population II Cepheids	197
4.5.3	Anomalous Cepheids	201
4.5.3.1	The Evolutionary Scenario for AC Stars	202
4.5.4	Extremely Hot HB Pulsators: EC 14026	205
4.6	Red Clump Stars	206
4.6.1	Properties of the Red Clump in Simple Stellar Populations	209
4.6.2	The Red Clump in Composite Stellar Populations	211
4.7	The Effects of Non-canonical Processes on HB Evolution	213
4.7.1	The Observational Scenario	214
4.7.1.1	The “Jump” in the u Strömgren Photometric Passband	214
4.7.1.2	The Low Gravity Problem	215
4.7.1.3	Chemical Abundance Anomalies	216
4.7.1.4	Rotational Rate Distribution	217
4.7.1.5	The Gaps along the Horizontal Branch	220
4.7.2	The Theoretical Framework	220
5	Asymptotic Giant Branch	231
5.1	Overview	231
5.2	Early Asymptotic Giant Branch Evolution	232
5.3	The Thermally Pulsing Stage	236
5.3.1	Mixing Processes	240
5.3.1.1	The Numerical Problem of Modelling the Third Dredge Up	243
5.3.2	Nucleosynthesis	246
5.3.3	Evolution of Surface Chemical Abundances	251
5.4	Calibration of Evolutionary AGB Models	254

5.5	Synthetic AGB Stellar Models	257
5.5.1	Outline of the Method	259
5.6	Long Period Variables	260
5.7	Nucleocosmochronology	266
5.8	The End of the AGB and Post-AGB Evolution	268
5.8.1	The Evolution from the AGB to the WD Cooling Sequence	269
6	White Dwarf Cooling Sequences	275
6.1	General Properties and Simple Models	278
6.2	Detailed Models	280
6.2.1	Neutrino Emission, Envelope Contraction and Residual H-burning	280
6.2.2	EOS for the Ions	281
6.2.3	Neon Diffusion in the Core	286
6.2.4	Envelope Convection	287
6.2.5	Boundary Conditions	287
6.2.6	Evolutionary Results	287
6.2.7	Theoretical Uncertainties	291
6.3	Colour–Magnitude Diagrams of WD Populations	294
6.3.1	Isochrones and Luminosity Functions	296
6.4	Spectroscopic Classification of WDs	300
6.5	Low Mass CO- and He-core WDs	302
7	Resolved Old Stellar Populations in the Galaxy	305
7.1	Introduction	305
7.2	Old Star Cluster Distances	306
7.2.1	Main-Sequence Fitting	306
7.2.2	Tip of the Red Giant Branch	312
7.2.3	Horizontal Branch Distances	317
7.2.3.1	Which Horizontal Branch Luminosity to Use?	318
7.2.3.2	The RR Lyrae Brightness–Metallicity Relation	320
7.2.3.3	Evolutionary Model Predictions and Their Uncertainty	323
7.2.3.4	RR Lyrae Stars in the Near-IR Bands: Observational and Theoretical Aspects	324
7.2.4	Red Clump	329
7.2.5	White Dwarf Fitting	334
7.3	Old Star Cluster Ages	337
7.3.1	Absolute Age Methods	338
7.3.2	How Reliable Is the Stellar “Clock”?	340
7.3.3	Relative Age Methods	343
7.3.4	Ages from the WD Cooling Sequence	350
7.4	Ages of Old Field Stars from Photometry/Spectroscopy	352
7.5	Empirical Rotation/Activity–Age Relationships	358
7.6	Estimates of the Primordial Helium Abundance	362
7.6.1	The Parameter R	363
7.6.2	The Parameter A	365
7.6.3	The Parameter Δ	367

7.6.4	The Parameter $\Delta\xi$	368
7.7	Estimates of the Primordial Lithium Abundance	368
7.7.1	Li in Globular Clusters	374
7.7.2	Li in Lower RGB Stars	376
7.8	Multiple Stellar Populations in Galactic Globular Clusters	378
7.8.1	The Spectroscopic Evidence	378
7.8.2	The Photometric Evidence	382
7.8.3	The Theoretical Evolutionary Framework	388
7.8.4	Formation Scenarios	396
8	Resolved Composite Systems	399
8.1	Synthetic CMD-fitting	400
8.2	Multiple Isochrone-fitting	405
9	Unresolved Old Systems	411
9.1	Building Blocks of a SPSM	412
9.2	Low-Resolution Diagnostics	415
9.2.1	Integrated Colour Fitting	420
9.2.1.1	Colour-Bimodality of Extragalactic Globular Clusters	428
9.2.2	Integrated Magnitude Fitting	430
9.2.3	Effect of Dynamical Evolution	435
9.2.4	Statistical Fluctuations	437
9.2.5	Binaries	440
9.2.6	Mass-to-Light Ratios	443
9.2.7	Surface Brightness Fluctuations	448
9.3	High-Resolution Diagnostics	455
9.3.1	HB Morphology	463
9.3.1.1	UV-upturn in Elliptical Galaxies	467
9.3.2	Estimating Individual Element Abundances	469
9.3.3	Statistical Fluctuations	472
9.3.4	The Effect of Binaries	473
9.4	Unresolved Composite Systems	473
9.5	Validation of Stellar Population Synthesis Techniques	475
