Foreword VII

Preface XIII

1	Making Computation Faster and Communication Secure: Quantum Solution	1
1.1	Turing Machine: a Real Machine or ...	1
1.2	... a Mathematical Procedure	2
1.3	Faster Super-Turing Computation	4
1.4	Digital Computers Do Not Run on Logic	5
1.5	Speeding up Computation: Classical Analog Computation ...	9
1.6	... vs. Quantum Physical Computation	14
1.7	Complexity Limits: Exponential Time	17
1.8	Energy Limits ...	23
1.9	... and Reversible Gates	27
1.10	Ultimate Efficiency: Quantum Computers and Qubits	32
1.11	Combining and Measuring Qubits: Quantum Superposition – Qubit Primer	35
1.12	Generating Qubits: Sources of Photons – Polarization Primer	49
1.13	Correlating Unpolarized Qubits: Quantum Entanglement	56
1.14	Separating and Transforming Entanglements: Bell States at a Beam Splitter	66
1.15	Manipulating and Verifying Entanglements: Superdense Coding	76
1.16	Copying Qubits? No. Teleporting Qubits!	93
1.17	Unperformed Measurements Have no Values: Kochen–Specker Sets	110
1.18	Controlling Qubits: Quantum Gates and Circuits	130
1.19	Self-Sustaining Qubits: Quantum Error Correction	141
1.20	Flying Qubits Connecting Quantum Chips and Computers: Quantum Repeaters	149
1.21	Why Classical Cryptography Cannot Keep Secrets for Long ...	151
1.22	... and Why Quantum Cryptography Can?	157
1.22.1	Entanglement in Action: Deterministic Communication	161
1.22.2	No-cloning in Action: Probabilistic BB84 Protocol	166

1.23	Why There Can Be No Quantum Eavesdroppers? Unconditional Security	169
2	Quantum Computation and Communication Hardware	175
2.1	Technological Candidates for Quantum Computation Implementation	175
2.2	All-Optical Scalable Quantum Computation	179
2.2.1	Probabilistic Parity Check Gate with a Quantum Encoder	180
2.2.2	Destructive CNOT Gate	183
2.2.3	Nondestructive Probabilistic Full CNOT Gate	186
2.2.4	The Teleportation Trick	188
2.2.5	Scalable Computation	191
2.3	Trapped Ions	192
2.4	Nuclear Magnetic Resonance	208
2.5	Silicon-Based Nuclear Spins – Kane’s Computer	215
2.6	Quantum Dots	223
2.6.1	Energy-Level Design; Quantum Dots in a Microcavity	226
2.6.2	Atom–Cavity Interaction between Levels $ 0\rangle$ and $ 1\rangle$	227
2.6.3	Laser–Atom Interaction between $ 0\rangle$ and $ 1\rangle$	227
2.6.4	Atom–Cavity and Laser–Atom Interactions between $ 0\rangle$ and $ 2\rangle$	228
2.6.5	Implementation of a CNOT Gate	228
2.6.6	Reading out the Results; Perspectives	230
2.6.7	Spin-Level Design; Array of Coupled Quantum Dots	231
2.7	Superconducting Devices	235
2.7.1	Josephson Junction	238
2.7.2	Josephson Junction Circuit and Hamiltonian	239
2.7.3	Josephson Junction Cooper-Pair Box	240
2.7.4	Superconducting Quantum Interference Device – SQUID	240
2.7.5	Cooper Pairs	241
2.7.6	Quantum Gates for Single Qubits	243
2.7.7	Quantum Gates for Two Qubits – CNOT Gate	246
2.7.8	Reading out the Results	249
3	Melting Theory with Implementation	251
3.1	Quantum Network	251
3.1.1	One-Atom Laser and Atom–Cavity Coupling	251
3.1.2	Single Photons on Demand	252
3.1.3	Dark States	253
3.1.4	Quantum Repeaters Revisited	261
3.2	Quantum-Classical Coupling: Interaction-Free Computation	266
3.3	Quantum Algorithms: Quantum or Classical Problems?	281
3.3.1	Are there Universal Quantum Algorithms?	281
3.3.2	Quantum Coin – Deutsch’s Algorithm	282
3.3.3	Deutsch–Jozsa and Bernstein–Vazirani Algorithms	284
3.3.4	Shor’s Algorithm	287
3.3.5	Quantum Simulators	292

4	Beyond Standard Qubit Computation	297
4.1	Persistent Entanglement	297
4.2	One-Way Computing and Cluster States	298
4.2.1	Dumping Reversibility and Unitarity?	298
4.2.2	Irreversible Measurement Setup	299
4.2.3	Reversibility and Unitarity Revisited	301
4.3	Continuous Variables	302
4.3.1	Continuous Entanglement	303
4.3.2	Second-Order (One-Photon) vs. Fourth-Order (Two-Photon) Interference	303
4.3.3	Qubits with Continuous Spatial Degree of Freedom	304
4.3.4	Universal Quantum Computation with Continuous-Variable Cluster States	306
5	Epilogue – Hybrid Systems	307
	List of Figures	309
	List of Tables	313
	References	315
	Index	331
