1 Introduction	1
References	5
2 Line Groups Structure	7
2.1 Factorization of the Line Groups	7
2.1.1 Generalized Translations: Symmetry of Arrangements	8
2.1.2 Axial Point Groups: Intrinsic Monomer Symmetry	9
2.1.3 Compatible Intrinsic and Arrangement Symmetries	11
2.1.4 Monomer, Elementary Cell, Symcell	14
2.1.5 Isogonal Groups	14
2.1.6 Spatial Inversion and Chirality	15
2.2 First Family Line Groups	17
2.2.1 Helix Generated by the Helical Group	17
2.2.2 Different Factorizations and Conventions	19
2.2.3 Commensurability	20
2.2.4 Isomorphisms and Physical Equivalence	23
2.2.5 Chirality	24
2.3 Other Families	25
2.3.1 Elements	25
2.3.2 First Family Subgroup	26
2.3.3 Subgroups Preserving z-Axis	26
2.3.4 International Notation	27
References	27
3 Symmetrical Compounds	29
3.1 Orbits of the Line Groups	29
3.1.1 Orbit, Stabilizer, and Transversal	29
3.1.2 Construction of the Orbit Types of the Line Groups	30
3.1.3 Monomers and Orbit Orders	31
3.1.4 Results	32
3.2 Conformation Classes and Their Symmetry	36
3.3 Symmetry Domain	41

3.4	Symmetry Fixing Sets	42
3.5	Application: Line Group Notation for Monoperiodic Crystals	43
	References	46
4	Irreducible Representations	47
4.1	First Family	47
4.1.1	Helical Quantum Numbers	48
4.1.2	Commensurate Groups and Linear Quantum Numbers	48
4.1.3	Transition Rules	49
4.1.4	Brillouin Zones and Bands	50
4.1.5	Special Points	51
4.1.6	Zigzag Groups	52
4.2	Other Families	53
4.3	Properties of the Representations	55
4.3.1	Reduced Brillouin Zones and Bands	59
4.3.2	Symmetry-Adapted Basis	61
4.3.3	Dimensions and Compatibility Relations	62
4.3.4	Reality of Representations	63
	References	64
5	Tensors	65
5.1	Standard Components	65
5.2	Functions: Invariants and Covariants	66
5.2.1	Harmonics	66
5.2.2	Covariants	71
5.3	Vectors	75
5.4	Second-Rank Tensors	77
5.5	Application: Clebsch–Gordan Coefficients and Selection Rules	82
	References	84
6	Magnetic Line Groups	85
6.1	Classification	85
6.1.1	Structure	85
6.1.2	Construction	86
6.1.3	Results and Notation	87
6.2	Co-representations	90
6.2.1	Irreducible Co-representations	91
6.2.2	Gray Groups and Reality of Representations	91
6.2.3	Real or Physical Representations	92
6.3	Application: Spin Ordering	92
	References	93
7	Vibrational Analysis	95
7.1	Dynamical Representation	95

7.2	Normal Modes	109
7.3	Example: Polyacetylene	110
	References	111
8	Applications	113
8.1	Energy Bands and Bloch Functions	113
8.1.1	Eigenproblem and Bands	113
8.1.2	Band Topology	115
8.2	Symmetry Breaking and Epikernels	118
8.2.1	Epikernels of the First Family Groups	119
8.2.2	Equitranslational Epikernels	119
8.3	Optical and Vibrational Activity	122
8.3.1	Optical Transitions	122
8.3.2	Infrared Active Modes	124
8.3.3	Raman Active Modes	125
8.3.4	Vibronic Activity: Jahn–Teller Theorem	126
8.4	Diffraction	129
8.4.1	Symmetry and Orbit Amplitudes	129
8.4.2	Geometrical Factors of the Line Group Orbits	130
8.4.3	Characteristics of the Diffraction Patterns	131
8.4.4	Applications to the Multiorbit Systems	137
8.5	Numerical Implementations of the Line Groups	137
8.5.1	Tight-Binding Methods	138
8.5.2	Density Functional Relaxation	140
	References	141
9	Nanotubes	143
9.1	Symmetry of Nanotubes	143
9.1.1	Folded Translations: The First Family Subgroup	145
9.1.2	Commensurability	146
9.1.3	Additional Symmetries	147
9.1.4	Symmetry-Based Common Characteristics of Nanotubes	149
9.2	Carbon Nanotubes	150
9.2.1	Single-Wall Nanotubes	151
9.2.2	Double- and Multi-Wall Nanotubes	165
	References	168
A	Koster–Seitz Notation	171
B	Rod Groups	173
C	Elements of the Number Theory	175

D Construction of the Representations	179
D.1 Irreducible Representations	179
D.1.1 Cyclic Groups	179
D.1.2 Direct Product	179
D.1.3 Induction from a Halving Subgroup	180
D.2 Co-representations of the Magnetic Groups	181
E Generalizations of the Line Groups	183
E.1 Continual Line Groups	184
E.2 Bi-helical Line Groups	184
F Modified Group Projector Technique	187
