Abstract	vii
Kurzfassung	ix
1 Introduction	1
1.1 Background	2
1.2 Motivation	2
1.3 Evolution of a thesis	3
1.4 Contributions	4
1.5 Outline	4
1.6 Notation	4
2 Philosophy	5
2.1 ADC function	5
2.2 The microscope analogy	6
2.3 Proposed system	6
2.4 Features	8
2.5 Limitations and caveats	9
2.6 Analog system design considerations	9
3 Principles of Operation and Calculations	11
3.1 General system model	11
3.2 First-order section	12
3.3 Second-order section	14
3.4 Control scaling	20
3.5 Matching to a Butterworth filter	26
3.6 Zooming properties of an unstable system	26
3.6.1 Range for a DC input signal	27
3.6.2 Range for a harmonic input signal	28

4	Estimation algorithm	31
4.1	Factor graph basics	31
4.2	Estimation function	33
4.3	Message passing rules	33
4.4	Haskell implementation	34
4.5	A word on hacks	35
5	Simulations	37
5.1	Parameter space	37
5.2	Simulator description	39
5.3	Figure of merit	39
5.4	First-order integrator	40
5.4.1	Base case	45
5.4.2	Observation bits	46
5.4.3	Input frequency dependency	48
5.4.4	Control bits	50
5.4.5	Integrator gain	51
5.5	Stable pole	52
5.6	Unstable pole	54
5.7	Multiple integrators in sequence	56
5.8	Estimation to intermediate state variable	58
5.9	Discussion of simulation results	60
5.10	Comparison to $\Sigma\Delta$ converter	62
6	Hardware and Measurements	65
6.1	Measured data	65
6.2	Estimation results	66
7	Conclusion and Future Work	67
7.1	A critical reflection	67
7.2	Outlook	68
A	Estimation on a simple system	69
A.1	State space derivation	69
A.2	Message passing rules	71
B	Experiment parameter documentation	75

C	Translinear folding ADC	91
C.1	Motivation	91
C.2	System proposal	91
C.3	Circuit	92
C.4	Recovery	92
C.5	Limitations	92
D	Normalized Butterworth filter polynomials	95
	Bibliography	97
	About the Author	99
