Abstract	9
Zusammenfassung	10
1. Introduction	12
2. Field velocity and rest field: concepts and basic properties	15
2.1 Electromagnetic fields in vacuum	15
2.2 Field velocity	18
2.3 Basic properties of the rest field	20
2.4 Further properties of the rest field	24
2.5 Rest charge, rest current, and charge velocity	25
2.6 Classical energy velocity	27
2.7 Further velocity aspects	28
2.8 Lorentz invariances	29
2.9 Basal electromagnetic field	29
2.10 Local decomposition into oppositely propagating planar waves	32
3. Field velocity and rest field: further properties	33
3.1 Lorentz transformation of the field velocity	33
3.2 Lorentz transformation of the electric and magnetic rest fields	37
3.3 Field velocity and Einstein rules for compounding velocities	38
3.4 Special case: field locally at rest	39
3.5 Lorentz transformation of rest charge and rest current	40
3.6 Generalized field velocity	42
3.7 Velocity equivalence class and the Einstein rules for compounding velocities	44
3.8 Some properties for $v_0 \rightarrow c$	44
4. Mechanistic properties of the electromagnetic field	45
4.1 Flow equations	45
4.2 Flow equations of a basal electromagnetic field	49
4.3 Electromagnetic fluid and relativistic interpretation	51
4.4 Beyond Maxwell's equations	54

5. Localized basal electromagnetic fields: rotating field	55
5.1 Nonlinear partial differential equations describing the field	55
5.2 Use of normalized quantities	58
5.3 Major characteristic values of a rotating field	59
5.4 Sommerfeld's fine structure constant	60
5.5 Incompleteness of the original formulation	61
5.6 Nominal values of frequency, velocity, and radius	62
6. Localized basal electromagnetic fields: planar field	65
6.1 Determination of the general solution	65
6.2 Spectral properties	67
6.3 Change of reference frame	68
6.4 Charge and polarization	70
6.4.1 <i>Linear polarization</i>	70
6.4.2 <i>Circular polarization</i>	72
6.5 Nominal frequency, size, energy, and momentum	75
6.6 Uncertainty properties	77
6.7 Properties as a wave packet	79
6.8 Further problems	80
6.9 Relation between electron, positron, and photon	81
7. Moving particles	83
7.1 Electron-like particle observed in different reference frames	83
7.1.1 <i>A first general relation</i>	83
7.1.2 <i>A second general relation</i>	85
7.1.3 <i>Some further details</i>	87
7.1.4 <i>Charge and current densities</i>	89
7.2 Behaviour in the presence of an external electrostatic field	90
7.2.1 <i>Dynamic equations of an electron-like model</i>	90
7.2.2 <i>Outline of supplementary proofs</i>	93
7.2.3 <i>Comments</i>	95
8. Concluding remarks	96
Acknowledgement	102

Appendix A: Reminders	102
A1. Some vector and matrix properties	102
A2. Spherical coordinates	104
Appendix B: Outline of proofs of some results in main body	104
B1. Proof of (2.60)	104
B2. Proof of (3.15)	105
B3. Proof of (3.38)	106
B4. An equivalence proof for Subsection 4.1	107
B5. Proof of (4.16)	107
Appendix C: Alternative relativistic dynamics	108
C1. Summary of results on alternative relativistic dynamics	108
C2. Comparison with classical derivations	110
C3. Flow equations of a basal EM field: mechanistic derivation of (4.22)	111
Appendix D: Symmetry requirements for a rotating field	113
D1. Requirements in spherical coordinates	113
D2. Some symmetry properties in Cartesian coordinates	115
Appendix E: Analytic signals and related results	116
E1. Analytic signal	116
E2. Uncertainty relation	118
E3. Group delay and group velocity	124
