Contents

1 **Introduction** 1
1-1 Motivation 1
1-2 Modern challenges 1
1-3 Facing the challenges 2
1-4 Concluding remarks 5

Part I Algebraic symbolic and numeric methods

2 **Basics of ring theory** 9
2-1 Some applications to geodesy and geoinformatics 9
2-2 Numbers from operational perspective 9
2-3 Number rings 13
2-4 Concluding remarks 16

3 **Basics of polynomial theory** 17
3-1 Polynomial equations 17
3-2 Polynomial rings 18
3-21 Polynomial objects as rings 18
3-22 Operations "addition" and "multiplication" 20
3-3 Factoring polynomials 21
3-4 Polynomial roots 21
3-5 Minimal polynomials 22
3-6 Univariate polynomials with real coefficients 23
3-61 Quadratic polynomials 23
3-62 Cubic polynomials 25
3-63 Quartic polynomials 26
3-7 Methods for investigating roots 27
3-71 Logarithmic and contour plots on complex plane 27
3-72 Isograph simulator 29
3-73 Application of inverse series 29
3-8 Computation of zeros of polynomial systems 30
3-9 Concluding remarks 32

4 **Groebner basis** 33
4-1 The origin 33
4-2 Basics of Groebner basis 34
4-3 Buchberger algorithm 40
4-31 Mathematica computation of Groebner basis 45
4-32 Maple computation of Groebner basis 46
4-4 Concluding remarks 47

digitalisiert durch DEUTSCHE NATIONAL BIBLIOTHEK

5 Polynomial resultants 49
5-1 Resultants: An alternative to Groebner basis 49
5-2 Sylvester resultants 49
5-3 Multipolynomial resultants 51
5-31 F. Macaulay formulation: 52
5-32 B. Sturmfels' formulation 54
5-33 The Dixon resultant 55
5-331 Basic concepts 55
5-332 Formulation of the Dixon resultant 56
5-333 Dixon's generalization of the Cayley-Bézout method 57
5-334 Improved Dixon resultant - Kapur-Saxena-Yang method 58
5-335 Heuristic methods to accelerate the Dixon resultant 59
5-336 Early discovery of factors: the EDF method 60
5-4 Concluding remarks 61

6 Linear homotpy 63
6-1 Introductory remarks 63
6-2 Background to homotopy 63
6-3 Definition and basic concepts 64
6-4 Solving nonlinear equations via homotopy 65
6-41 Tracing homotopy path as initial value problem 69
6-42 Types of linear homotopy 71
6-421 Fixed point homotopy 71
6-422 Newton homotopy 71
6-423 Start system for polynomial systems 72
6-5 Concluding remarks 76

7 Solutions of Overdetermined Systems 79
7-1 Estimating geodetic and geoinformatics unknowns 79
7-2 Algebraic LEast Square Solution (ALESS) 80
7-21 Transforming overdetermined systems to determined 80
7-22 Solving the determined system 82
7-3 Gauss-Jacobi combinatorial algorithm 84
7-31 Combinatorial approach: the origin 84
7-32 Linear and nonlinear Gauss-Markov models 87
7-33 Gauss-Jacobi combinatorial formulation 88
7-331 Combinatorial solution of nonlinear Gauss-Markov model 92
7-332 Construction of minimal combinatorial subsets 92
7-333 Optimization of combinatorial solutions 93
7-334 The Gauss-Jacobi combinatorial algorithm 97
7-4 Concluding remarks 98

8 Extended Newton-Raphson method 101
8-1 Introductory remarks 101
8-2 The standard Newton-Raphson approach 102
8-3 Examples of limitations of the standard approach 102
8-31 Overdetermined polynomial systems 102
8-32 Overdetermined non-polynomial system 104
8-33 Determined polynomial system 105
8-34 Underdetermined polynomial system 106
8-4 Extending the Newton-Raphson approach using pseudoinverse 107
8-5 Applications of the Extended Newton-Raphson method 108
8-6 Concluding remarks 110

9 Procrustes solution 111
9-1 Motivation 111
9-2 Procrustes: Origin and applications 112
9-21 Procrustes and the magic bed 112
9-22 Multidimensional scaling 114
9-23 Applications of Procrustes in medicine 114
9-231 Gene recognition 114
9-232 Identification of malaria parasites 115
9-3 Partial procrustes solution 116
9-31 Conventional formulation 116
9-32 Partial derivative formulation 118
9-4 The General Procrustes solution 119
9-5 Extended general Procrustes solution 130
9-51 Mild anisotropy in scaling 130
9-52 Strong anisotropy in scalling 131
9-6 Weighted Procrustes transformation 133
9-7 Concluding remarks 135

Part II Applications to geodesy and geoinformatics

10 LPS-GNSS orientations and vertical deflections 139
10-1 Introductory remarks 139
10-2 Positioning systems 140
10-3 Global positioning system (GPS) 141
10-4 Local positioning systems (LPS) 142
10-41 Local datum choice in an LPS 3-D network 142
10-42 Relationship between global and local level reference frames 144
10-43 Observation equations 145
10-5 Three-dimensional orientation problem 146
10-51 Procrustes solution of the orientation problem 147
10-52 Determination of vertical deflection 149
10-6 Example: Test network Stuttgart Central 150
10-7 Concluding remarks 153

11 Cartesian to ellipsoidal mapping 155
11-1 Introductory remarks 155
11-2 Mapping topographical points onto reference ellipsoid 155
11-3 Mapping geometry 158
11-4 Minimum distance mapping 160
11-41 Grafarend-Lohse's mapping of $\mathbb{T}^2 \longrightarrow \mathbb{E}^2_{a,a,b}$ 163
11-42 Groebner basis' mapping of $\mathbb{T}^2 \longrightarrow \mathbb{E}^2_{a,a,b}$ 164
11-43 Extended Newton-Raphson's mapping of $\mathbb{T}^2 \longrightarrow \mathbb{E}^2_{a,a,b}$ 166
11-5 Concluding remarks 171

12 Positioning by ranging 173
12-1 Applications of distances 173
12-2 Ranging by global navigation satellite system (GNSS) 174
12-21 The pseudo-ranging four-points problem 174
12-211 Sturmfels' approach 177
12-212 Groebner basis approach 179
12-22 Ranging to more than four GPS satellites 181
12-221 Extended Newton-Raphson solution 185
12-222 Homotopy solution of GPS N-point problem 187
12-223 Least squares versus Gauss-Jacobi combinatorial 189
12-3 Ranging by local positioning systems (LPS) 191
12-31 Planar ranging 192
12-311 Conventional approach 192
12-312 Sylvester resultants approach 193
12-313 Reduced Groebner basis approach 194
12-314 Planar ranging to more than two known stations 198
12-315 ALESS solution of overdetermined planar ranging problem 200
12-32 Three-dimensional ranging 203
12-321 Closed form three-dimensional ranging 203
12-322 Conventional approaches 204
12-323 Solution by elimination approach-2 205
12-324 Groebner basis approach 206
12-325 Polynomial resultants approach 207
12-326 N-point three-dimensional ranging 211
12-327 ALESS solution 212
12-328 Extended Newton-Raphson's solution 215
12-4 Concluding remarks 216

13 Positioning by resection methods 217
13-1 Resection problem and its importance 217
13-2 Geodetic resection 220
13-21 Planar resection 220
13-211 Conventional analytical solution 220
13-212 Groebner basis approach 222

13-213 Sturmfels' resultant approach 223
13-22 Three-dimensional resection 226
13-221 Exact solution 226
13-222 Solution of Grunert's distance equations 226
13-223 Groebner basis solution of Grunert's equations 228
13-224 Polynomial resultants' solution of Grunert's distance equations 230
13-225 Linear homotopy solution 233
13-226 Grafarend-Lohse-Schaffrin approach 237
13-227 3d-resection to more than three known stations 240
13-3 Photogrammetric resection 244
13-31 Grafarend-Shan Möbius photogrammetric resection 245
13-32 Algebraic photogrammetric resection 246
13-4 Concluding remarks 248

14 Positioning by intersection methods 249
14-1 Intersection problem and its importance 249
14-2 Geodetic intersection 250
14-21 Planar intersection 250
14-211 Conventional solution 250
14-212 reduced Groebner basis solution 251
14-22 Three-dimensional intersection 254
14-221 Closed form solution 254
14-222 Conventional solution 255
14-223 Reduced Groebner basis solution 255
14-224 Sturmfels' resultants solution 256
14-225 Intersection to more than three known stations 259
14-3 Photogrammetric intersection 261
14-306 Grafarend-Shan Möbius approach 262
14-307 Commutative algebraic approaches 263
14-4 Concluding remarks 263

15 GNSS environmental monitoring 265
15-1 Satellite environmental monitoring 265
15-2 GNSS remote sensing 269
15-21 Space borne GNSS meteorology 269
15-22 Ground based GNSS meteorology 271
15-3 Refraction (bending) angles 273
15-31 Transformation of trigonometric equations to algebraic 274
15-32 Algebraic determination of bending angles 276
15-321 Application of Groebner basis 276
15-322 Sylvester resultants solution 277
15-4 Algebraic analysis of some CHAMP data 278
15-5 Concluding remarks 286

16 Algebraic diagnosis of outliers 289
16-1 Outliers in observation samples 289
16-2 Algebraic diagnosis of outliers 290
16-21 Outlier diagnosis in planar ranging 292
16-22 Diagnosis of multipath error in GNSS positioning 296
16-3 Concluding remarks 300

17 Datum transformation problems 303
17-1 The 7-parameter datum transformation and its importance 303
17-2 Algebraic solution of the 7-parameter transformation problem 305
17-21 Groebner basis transformation 305
17-22 Dixon resultant solution 309
17-23 Gauss-Jacobi combinatorial transformation 313
17-3 The 9-parameter (affine) datum transformation 318
17-4 Algebraic solution of the 9-parameter transformation 320
17-41 The 3-point affine transformation problem 320
17-411 Simplifications for the symbolic solution 320
17-412 Symbolic solution with Dixon resultant 321
17-413 Symbolic solution with reduced Groebner basis 323
17-42 The N-points problem 325
17-421 ALESS approach to overdetermined cases 327
17-422 Homotopy solution of the ALESS-determined model 329
17-43 Procrustes solution 333
17-5 Concluding remark 337

Appendix 339
Appendix A-1: Definitions 339
Appendix A-2: C. F. Gauss combinatorial approach 340
Appendix A-3: Linear homotopy 343
Appendix A-4: Determined system of the 9-parameter transformation N point problem 344
