|----------|---------------------------------------------------------------------------------|-----------|
| <b>1</b> | <b>The Variety of Finite Fermion Systems and Their Basic Properties . . . .</b> | <b>1</b>  |
| 1.1      | Fermions in the Universe . . . . .                                              | 3         |
| 1.1.1    | The Four Elementary Interactions . . . . .                                      | 3         |
| 1.1.2    | Basics of Nuclei . . . . .                                                      | 4         |
| 1.1.3    | Basics of the Electronic Cloud in Atoms . . . . .                               | 8         |
| 1.1.4    | Basics of Molecular Binding . . . . .                                           | 12        |
| 1.1.5    | Basics of Metal Clusters . . . . .                                              | 14        |
| 1.1.6    | Quantum Dots . . . . .                                                          | 19        |
| 1.1.7    | Basics of $^3\text{He}$ Droplets . . . . .                                      | 21        |
| 1.1.8    | Degenerate Fermion Gas: Atom Traps, White Dwarfs,<br>Neutron Stars . . . . .    | 22        |
| 1.2      | Similar and Different . . . . .                                                 | 26        |
| 1.2.1    | Overview of Many-Fermion Systems . . . . .                                      | 26        |
| 1.2.2    | Scales and Interactions . . . . .                                               | 27        |
| 1.2.3    | Shells in Finite Systems . . . . .                                              | 29        |
| 1.2.4    | Beyond the Static Mean Field . . . . .                                          | 31        |
| 1.3      | Basic Theoretical Tools . . . . .                                               | 35        |
| 1.3.1    | The Wave Function Approach . . . . .                                            | 35        |
| 1.3.2    | Creation and Annihilation Operators . . . . .                                   | 37        |
| 1.3.3    | Density Matrices . . . . .                                                      | 40        |
| 1.4      | Concluding Remarks . . . . .                                                    | 42        |
| <br>     |                                                                                 |           |
| <b>2</b> | <b>The Fermi-Gas Model . . . . .</b>                                            | <b>45</b> |
| 2.1      | From Finite Box to Continuum States . . . . .                                   | 46        |
| 2.1.1    | Single-Fermion Wave Functions in General . . . . .                              | 46        |
| 2.1.2    | From Bound States to Plane Waves . . . . .                                      | 47        |
| 2.2      | Basics: Density, Fermi Momentum, Fermi Energy . . . . .                         | 51        |
| 2.2.1    | Fermi Momentum, Fermi Energy, Density . . . . .                                 | 51        |
| 2.2.2    | The One-Body Density Matrix . . . . .                                           | 53        |
| 2.2.3    | A Model for the One-Body Density Matrix<br>in Finite Systems . . . . .          | 55        |

|          |                                                             |           |
|----------|-------------------------------------------------------------|-----------|
| 2.2.4    | The Two-Body Density .....                                  | 56        |
| 2.2.5    | The Kinetic Energy .....                                    | 57        |
| 2.2.6    | The Level Density .....                                     | 59        |
| 2.3      | Fermi Gas at Finite Temperature .....                       | 59        |
| 2.4      | Fermi Gas in Stars: The Example of White Dwarfs .....       | 63        |
| 2.4.1    | “Low” Densities .....                                       | 63        |
| 2.4.2    | Stability in the Relativistic Domain .....                  | 64        |
| 2.5      | Coulomb Energy of a Charged Fermi Gas .....                 | 66        |
| 2.6      | Concluding Remarks .....                                    | 69        |
| <b>3</b> | <b>Particles in an External Field .....</b>                 | <b>71</b> |
| 3.1      | The Variety of Shell-Model Potentials .....                 | 71        |
| 3.1.1    | Saturating Fermion Systems .....                            | 71        |
| 3.1.2    | Atomic Systems .....                                        | 73        |
| 3.2      | The Harmonic Oscillator in the Various Subfields .....      | 74        |
| 3.2.1    | The Harmonic Oscillator in Two and Three Dimensions .....   | 75        |
| 3.2.2    | The 3D Oscillator Atomic Traps .....                        | 76        |
| 3.2.3    | The 2D Oscillator for Quantum Dots .....                    | 76        |
| 3.2.4    | The Clemenger–Nilsson Model for Metal Clusters .....        | 77        |
| 3.2.5    | The Nilsson Model for Nuclei .....                          | 78        |
| 3.2.6    | Comparison of Spectra .....                                 | 79        |
| 3.3      | Applications .....                                          | 80        |
| 3.3.1    | Metal Clusters .....                                        | 80        |
| 3.3.2    | Quantum Dot in a Magnetic Field .....                       | 83        |
| 3.3.3    | Nuclei .....                                                | 85        |
| 3.4      | Concluding Remarks .....                                    | 91        |
| <b>4</b> | <b>Approaches Based on Model Spaces .....</b>               | <b>93</b> |
| 4.1      | Valence-Bond Theory .....                                   | 94        |
| 4.1.1    | Dimer Molecules .....                                       | 94        |
| 4.1.2    | $\sigma$ - and $\pi$ -Orbitals .....                        | 95        |
| 4.1.3    | Polyatomic Molecules .....                                  | 97        |
| 4.2      | Linear Combination of Atomic Orbitals (LCAO) .....          | 99        |
| 4.2.1    | LCAO in Dimer Molecules .....                               | 100       |
| 4.2.2    | A Quick Look at Neutral Dimers .....                        | 104       |
| 4.2.3    | From Dimer to Large Molecules .....                         | 105       |
| 4.3      | The Hückel Approximation .....                              | 105       |
| 4.3.1    | Conjugated Molecules .....                                  | 105       |
| 4.3.2    | Bulk Solid .....                                            | 108       |
| 4.4      | From Model Spaces to Realistic Calculations .....           | 110       |
| 4.4.1    | Example: $\text{H}_2^+$ Dimer in LCAO with Gaussians .....  | 111       |
| 4.4.2    | Toward Fully Realistic Quantum Chemistry Calculations ..... | 115       |
| 4.5      | Concluding Remarks .....                                    | 116       |

|          |                                                                      |     |
|----------|----------------------------------------------------------------------|-----|
| <b>5</b> | <b>Hartree–Fock</b>                                                  | 117 |
| 5.1      | The Hartree–Fock Setup                                               | 117 |
| 5.1.1    | Foundation                                                           | 117 |
| 5.1.2    | The Hartree–Fock Approximation                                       | 118 |
| 5.1.3    | The Space of Variations of a Slater State                            | 120 |
| 5.2      | The Hartree–Fock Equations                                           | 121 |
| 5.2.1    | In Terms of Fermion Operators                                        | 121 |
| 5.2.2    | In Configuration Space (Matrix Elements)                             | 122 |
| 5.2.3    | In Coordinate Space                                                  | 124 |
| 5.3      | The Hartree–Fock Energy                                              | 126 |
| 5.3.1    | The Total Energy                                                     | 126 |
| 5.3.2    | The Interpretation of Single-Particle Energies:<br>Koopman’s Theorem | 127 |
| 5.3.3    | Excitations and Excitation Energies                                  | 128 |
| 5.4      | The Density Matrix Formulation                                       | 129 |
| 5.5      | A Simple Test Case: Two Particles in 1D                              | 130 |
| 5.5.1    | The Model                                                            | 130 |
| 5.5.2    | The Total Energy                                                     | 131 |
| 5.5.3    | The Hartree–Fock Equation                                            | 132 |
| 5.5.4    | A Closed Solution                                                    | 133 |
| 5.5.5    | Symmetry Breaking                                                    | 134 |
| 5.6      | An Illustrative Example: The He Atom                                 | 135 |
| 5.6.1    | Hamiltonian and HF Equations                                         | 136 |
| 5.6.2    | Variational Ansatz                                                   | 137 |
| 5.6.3    | Full HF Solution                                                     | 139 |
| 5.7      | Concluding Remarks                                                   | 140 |
| <b>6</b> | <b>Density Functional Theory</b>                                     | 143 |
| 6.1      | Basics of Electronic Density Functional Theory (DFT)                 | 144 |
| 6.1.1    | The Hohenberg–Kohn Theorem                                           | 144 |
| 6.1.2    | The Local Density Approximation                                      | 145 |
| 6.1.3    | Kohn–Sham Approach                                                   | 147 |
| 6.2      | Back to the Example of the He Atom                                   | 149 |
