1	Introduction	1
1.1	Fixed-parameter linear-time algorithms	3
1.2	Linear-time kernelization	4
1.3	Overview	5
2	Preliminaries	7
2.1	Sets, relations, and functions	7
2.2	Graph theory	10
2.2.1	Graphs and hypergraphs	10
2.2.2	Relations and operations on graphs	12
2.2.3	Structures, topology, and parameters	14
2.2.4	Graph classes and special graphs	16
2.3	Computational complexity	17
2.3.1	What is time?	18
2.3.2	Optimization problems versus decision problems	19
2.3.3	P versus NP	20
2.3.4	NP-hardness and completeness	21
2.4	Parameterized complexity	22
2.4.1	Fixed-parameter tractability	22
2.4.2	Parameterized hardness	24
2.4.3	Problem kernelization	24
2.4.4	Lower bounds on the problem kernel size	25
2.5	Fixed-parameter algorithms for graphs of bounded treewidth	26
2.5.1	Monadic second-order logic	28
2.5.2	Tree automata	29
3	Job Interval Selection and 2-Union Independent Set	33
3.1	Introduction	34
3.1.1	Known results	36
3.1.2	Our results	37

3.1.3	Chapter outline	39
3.2	Colorful independent sets	40
3.2.1	A colorful version of Job Interval Selection	40
3.2.2	Colorful Independent Set with Lists	42
3.2.3	Advantages and limitations of the model	44
3.3	A complexity dichotomy	44
3.4	Compact interval graphs	53
3.5	Job Interval Selection	57
3.5.1	A simple search tree algorithm	57
3.5.2	Generalizations of a known dynamic program	59
3.5.3	Problem kernelization	67
3.6	2-Union Independent Set	72
3.6.1	A dynamic program for compact interval graphs	73
3.6.2	Problem kernelization	74
3.7	Experimental evaluation	77
3.8	Conclusion	81
4	DAG Partitioning	83
4.1	Introduction	83
4.1.1	Known results	84
4.1.2	Our results	85
4.1.3	Chapter outline	86
4.2	The structure of minimal partitioning sets	86
4.3	Finding constant-weight partitioning sets in linear time	88
4.3.1	A search tree algorithm	88
4.3.2	Linear-time data reduction	92
4.3.3	Lower bounds	97
4.3.4	Experimental evaluation	105
4.4	Linear-time partitioning tree-like graphs	112
4.5	Stronger NP-hardness results	117
4.6	Conclusion	122
5	Hitting Set	123
5.1	Introduction	123
5.1.1	Known results	124
5.1.2	Our results	126
5.1.3	Chapter outline	126
5.2	Expressive kernelization	126

5.3	A linear-time kernelization algorithm	130
5.3.1	Correctness	132
5.3.2	Problem kernel size	134
5.3.3	Running time	136
5.4	Experimental evaluation	138
5.5	Reducing the number of vertices in $O(k^{1.5d})$ additional time	145
5.5.1	The approaches of Abu-Khzam and Moser	145
5.5.2	Our improvements	147
5.6	Conclusion	150
6	Hypergraph Cutwidth and a general method	151
6.1	Introduction	151
6.1.1	Known results	154
6.1.2	Our results	155
6.1.3	Chapter outline	155
6.2	A Myhill-Nerode theorem for hypergraphs	155
6.2.1	Regular languages	156
6.2.2	Colored graphs	156
6.2.3	Hypergraphs	163
6.3	Using the Myhill-Nerode theorem	169
6.3.1	Deriving fixed-parameter linear-time algorithms	169
6.3.2	Expressibility in monadic second-order logic	171
6.4	Hypergraph Cutwidth is fixed-parameter linear	173
6.4.1	Hypergraph cutwidth bounds incidence treewidth	175
6.4.2	Tests for constant cutwidth	176
6.4.3	Shrinking tests to constant size	181
6.5	Hypertree width and variants	184
6.6	Conclusion	185
7	Conclusion and outlook	187
	Bibliography	191
