

Contents

1	Introduction.	1
1.1	Status Quo and Trends of Interconnected Systems	1
1.2	Stability Problems of Interconnected Systems	3
1.3	WAMS Technology and Its Application in Interconnected Systems	4
1.4	Low-Frequency Oscillation Analysis Methods	5
1.5	Challenges of Wide Area Dynamic Monitoring and Control	7
	References	9
2	Theoretical Foundation of Low-Frequency Oscillations	13
2.1	The Basic Principles of Low-Frequency Oscillation	13
2.1.1	Local Mode	14
2.1.2	Inter-Area Mode	16
2.2	Techniques Based on System Model	19
2.2.1	Linearization of the State Equation	20
2.2.2	Calculation of Eigenvalues and Eigenvectors	21
2.2.3	Determination of Oscillation Parameters	22
2.2.4	Brief Summary of System Model Analysis Techniques	23
2.3	Techniques Based on Measured Information	24
2.3.1	Discrete Fourier Transform	24
2.3.2	Prony Algorithm and Multi-Prony	26
2.3.3	Wavelet Transform and Its Improvements	29
2.3.4	Hilbert–Huang Transform	31
2.4	Summary	36
	References	36

3	Oscillatory Parameters Computation Based on Improved HHT . . .	39
3.1	Introduction of Improved Empirical Mode Decomposition (EMD)	39
3.1.1	The Selection of Stop Criterion for Sifting in EMD . . .	39
3.1.2	End Effects and Extrema Symmetrical Extension	41
3.1.3	Mode-Mixing and Frequency Heterodyne Technique (FHT)	44
3.1.4	The Improved EMD Based on ESE and FHT	50
3.2	Time and Frequency Analysis of Intrinsic Mode Function	51
3.3	Normalized Hilbert Transform (NHT)	53
3.3.1	Decompose the IMF into AM and FM Parts	54
3.3.2	Calculation of the Instantaneous Frequency	55
3.3.3	Calculation of the Instantaneous Amplitude and Damping Ratio	56
3.4	The Flowchart of the Improved HHT	56
3.5	Summary	57
	References	58
4	Oscillation Model Identification Based on Nonlinear Hybrid Method (NHM)	59
4.1	Identification of Dominant Oscillation Mode	59
4.2	The Processing of Oscillation Mode Identification	61
4.2.1	Calculation of the Absolute Phase (AP) and Relative Phase (RP) of IMF	61
4.2.2	Determination of Node Contribution Factor (NCF) . . .	62
4.2.3	Computation of Approximate Mode Shape (AMS) . . .	63
4.2.4	Coherency of the Measured Signals	64
4.2.5	Flowchart of the Nonlinear Hybrid Method (NHM) . . .	65
4.3	Study Case	67
4.4	Summary	74
	References	74
5	Identification of Dominant Complex Orthogonal Mode (COM). . .	75
5.1	Introduction of Spatial and Temporal Behaviors of Oscillation Mode	75
5.2	Construction of the Complex Ensemble Measurement Matrix	77
5.3	Implementations of Complex Orthogonal Decomposition (COD)	78
5.3.1	Complex Eigenvalues Decomposition (C-ED)	78
5.3.2	Complex Singular Value Decomposition (C-SVD) . . .	79
5.3.3	Augmented Matrix Decomposition (AMD)	80
5.3.4	Definition of Relevant COMs	82
5.4	Extraction of the Propagating Features	83
5.4.1	Spatial Energy Distribution	83

5.4.2	Temporal Dynamic Characteristics	83
5.4.3	Energy Contribution Factor (ECF)	84
5.5	The Flowchart of Proposed COD	84
5.6	Study Case	85
5.6.1	Description of Sliding Window	85
5.6.2	Sliding Window Recursive Algorithm (SWRA) of COD.	86
5.6.3	Applications of the COD-SWRA	87
5.7	Summary	91
	References	91
6	Basic Framework and Operating Principle of Wide-Area Damping Control	93
6.1	Basic Framework of Wide-Area Damping Control	93
6.2	Operating Principle of Wide-Area Damping Control	95
6.3	System Modeling	98
6.3.1	SMIB System with FACTS WADC	98
6.3.2	System Modeling Based on Direct Feedback Linearization Theory.	98
6.4	Summary	101
	References	101
7	Coordinated Design of Local PSSs and Wide-Area Damping Controller	103
7.1	Overview of Optimization Method	103
7.2	Description of Sequence Design and Global Optimization Method.	104
7.2.1	Structure of PSS and HVDC-WADC	104
7.2.2	Design Procedure	104
7.3	Methodological Implementation	107
7.3.1	Damping Distribution	107
7.3.2	Sequential Design.	107
7.3.3	Global Optimization	108
7.4	Case Study	109
7.4.1	AC/DC Hybrid Interconnected Systems.	109
7.4.2	Result of Damping Distribution	110
7.4.3	Design Result	112
7.4.4	Performance Validation.	114
7.5	Summary	118
	References	119
8	Robust Coordination of HVDC and FACTS Wide-Area Damping Controllers	121
8.1	Overview of Wide-Area Damping Control.	121
8.2	Description of Wide-Area Control Networks Using Multiple Power Electronics-Based Controllers.	122

8.3	Controller Design Formulation	123
8.3.1	Multi-objective Synthesis of Wide-Area Robust Control	123
8.3.2	Pole Placement in LMI Regions	124
8.4	Design Procedure of Wide-Area Robust Coordinated Control	125
8.5	Case Study	126
8.5.1	Choice of Suitable Wide-Area Control Signals	126
8.5.2	Robust Design of HVDC- and FACTS-WADC	128
8.5.3	Evaluation of Robust Performance	130
8.5.4	Nonlinear Simulation	132
8.6	Summary	134
	References	134
9	Assessment and Choice of Input Signals for Multiple Wide-Area Damping Controllers.	137
9.1	Overview of Signal Selection Methods	137
9.2	Description of Relative Gain Array and Residue Analysis	138
9.2.1	Power System Model	138
9.2.2	Residue Analysis Method	139
9.2.3	RGA Analysis Method	139
9.3	Signal Selection Procedure	141
9.4	Case Study	143
9.4.1	Preselection of Input Signal Candidates	144
9.4.2	Final Choice of Effective Input Signals	145
9.4.3	Comparison with Local Control and Other Wide-Area Control Pairs	147
9.4.4	Design of Multiple HVDC- and FACTS-WADCs	148
9.4.5	Validation of Control Performance	150
9.5	Summary	153
	References	154
10	Free-Weighting Matrix Method for Delay Compensation of Wide-Area Signals	155
10.1	Time-Delay Power System	155
10.1.1	Description of Delay Power System with Wide-Area Signals' Delay	156
10.1.2	Stability Analysis of Time-Delay Power System	158
10.2	Description of Free-Weighting Matrices (FWMs) Method	159
10.3	General Configuration of FACTS-WADC Based on FWMs Approach	162
10.4	FWMs Approach-Based FACTS-WADC Design	163
10.5	Cases Study	169
10.5.1	4-Machine 2-Area System	169
10.5.2	16-Machine 5-Area Test System	171

10.6	Summary	174
	References	177
11	Design and Implementation of Delay-Dependent Wide-Area Damping Control for Stability Enhancement of Power Systems	179
11.1	System Description	179
11.2	Hardware Design	180
11.3	Design of the Control Algorithm	184
11.3.1	Classic Phase Compensation Method	184
11.3.2	Delay-Dependent State-Feedback Robust Design Method	186
11.3.3	Delay-Dependent Dynamic Output-Feedback Control Method	189
11.4	Algorithm Implementation	191
11.4.1	Discrete-Time Model for the Hardware Controller	191
11.4.2	Algorithm Flowchart	194
11.5	Experimental Results	197
11.6	Summary	201
	References	201
12	Design and Implementation of Parallel Processing in Embedded PDC Application for FACTS Wide-Area Damping Control	203
12.1	System Description	203
12.2	Design of the Embedded System	205
12.3	Implementation of the Embedded System	207
12.3.1	Data Receiving via Communication Network	207
12.3.2	Data Processing	208
12.3.3	Monitoring and Protection	210
12.3.4	Wide-Area Damping Controller	212
12.3.5	Control Output Through SPI and External DAC	213
12.4	Parallel Processing of the Embedded System	215
12.5	Experimental Result	217
12.6	Summary	223
