

Contents

1. Introduction	7
2. Conventions and light-cone formalism	11
3. Aspects of the operator product expansion	15
3.1. Formulation of the problem	15
3.2. Operator product expansion to kinematic twist-4 accuracy	19
3.2.1. Twist-2	21
3.2.2. Twist-3	21
3.2.3. Twist-4	21
3.3. On gauge invariance and translations	22
4. Deeply virtual Compton scattering	25
4.1. Basics	25
4.2. Helicity amplitudes	28
4.3. Generalized parton distributions in a nutshell	32
5. Calculation of helicity amplitudes	39
5.1. Notation	39
5.2. Transverse helicity flip $\mathcal{A}_{\pm\mp}$	40
5.2.1. Twist-2	40
5.2.2. Twist-3	42
5.2.3. Summary	44
5.3. Longitudinal-to-transverse helicity flip $\mathcal{A}_{0\pm}$	44
5.3.1. Twist-2	44
5.3.2. Twist-3	45
5.3.3. Summary	46
5.4. Helicity conserving amplitudes $\mathcal{A}_{\pm\pm}$	46
5.4.1. Difference term $\delta\mathcal{A}$	48
5.4.2. Trace part $\mathcal{A}_{\text{T}}$	49
5.4.3. Helicity difference $\Delta\mathcal{A}$	56
6. Discussion of the results	59
6.1. GPD expressions	59
6.2. Analyticity	61
6.2.1. On factorization	61
6.2.2. Dispersion relations	63
6.3. A byproduct: pion DVCS	66
6.4. Comparison with existing results	67
6.4.1. On the relation to Ref. [15] and the large- Q^2 limit	67
6.4.2. On the relation to Ref. [40] – twist-3 and partial twist-4	68
6.5. Compton form factors	71

7. Phenomenology: confronting physical observables	77
7.1. A different CFF basis: BMJ formulation	77
7.2. Model and conventions	80
7.3. Impact of power corrections in DVCS	84
7.3.1. Preliminaries	84
7.3.2. Fixed target, unpolarized	85
7.3.2.1. Beam spin sum/difference	85
7.3.2.2. Asymmetries	88
7.3.3. Fixed target, polarized	90
7.3.4. Collider experiments	92
8. Conclusions and outlook	95
A. The leading twist projector in practice	97
B. Fourier transformation cheat sheet	101
C. From DDs to GPDs	103
