Nomenclature	13
1 Introduction	17
1.1 General introduction and background	17
1.2 Structure of the thesis	19
1.3 Notational conventions	24
2 Literature review	26
2.1 Material and process	26
2.1.1 Nomenclature and differentiation	26
2.1.2 Direct compounding process	28
2.1.3 Compression molding	29
2.1.4 Effects of fiber length	30
2.1.5 Thermoplastic matrix material	34
2.2 Micromechanics and homogenization	35
2.2.1 Concept of homogenization	35
2.2.2 Classical stiffness prediction and homogenization methods	36
2.2.3 Advanced nonlinear modeling approaches	37
2.2.4 Representative volume element	38
2.2.5 Microstructure generation of discontinuous fiber com- posites	41

3	Experimental methods	45
3.1	Material and microstructure	45
3.1.1	Processing conditions	45
3.1.2	Fiber orientation distribution	47
3.1.3	Fiber length distribution	50
3.1.4	Fiber volume fraction	50
3.2	Tensile tests	51
3.2.1	Matrix specimens	51
3.2.2	LFT specimens	52
3.3	Creep tests	53
3.3.1	Matrix specimens	53
3.3.2	LFT specimens	54
3.4	Fiber push-out tests	54
4	Modeling techniques	56
4.1	Viscoelastic matrix model	56
4.1.1	Modeling strategy	56
4.1.2	Burgers four parameter model	57
4.1.3	Differential equation	58
4.1.4	Hereditary integral	59
4.1.5	Incremental form	59
4.1.6	3D generalization	60
4.1.7	Nonlinear modification and range of validity	65
4.1.8	Numerical implementation of nonlinearity	67
4.2	Plastic matrix model	73
4.3	Interface model	76
4.3.1	Simulation of fiber push-out	76
4.3.2	Traction-separation law	76
4.3.3	Contact formulation	79
4.4	Unidirectional fiber arrangement	80

4.5	Multidirectional LFT structure	83
4.5.1	Generation of a fiber stack	83
4.5.2	Fiber compression	87
4.5.3	Meshing and boundary conditions	90
4.5.4	Elasticity	93
4.5.5	Viscoelasticity	95
4.5.6	Plasticity and damage	96
4.6	Analytical homogenization	98
4.6.1	Halpin-Tsai equations	99
4.6.2	Orientation tensor	101
4.6.3	Orientation averaging	104
4.6.4	Length averaging	105
5	Results	106
5.1	Material and microstructure	106
5.1.1	Fiber orientation distribution	106
5.1.2	Fiber length distribution	106
5.1.3	Fiber volume fraction	108
5.1.4	Fracture surfaces	110
5.2	Viscoelastic matrix model	112
5.2.1	Model calibration	112
5.2.2	Model validation	114
5.2.3	Modified parameters	117
5.3	Plastic matrix model	121
5.4	Interface model	122
5.5	Unidirectional fiber arrangement	124
5.6	Multidirectional LFT structure	128
5.6.1	Nomenclature and microstructure characteristics	129
5.6.2	Elasticity - general	132
5.6.3	Elasticity - variation of RVE size	133

5.6.4	Elasticity - variation of fiber length	135
5.6.5	Elasticity - variation of FE mesh	136
5.6.6	Viscoelasticity - general	139
5.6.7	Viscoelasticity - variation of RVE size	144
5.6.8	Viscoelasticity - variation of fiber length	146
5.6.9	Viscoelasticity - variation of model formulation	146
5.6.10	Viscoelasticity - contour plots	150
5.6.11	Plasticity and damage - deformation and damage mechanisms	152
5.6.12	Plasticity and damage - experimental scatter	155
5.6.13	Plasticity and damage - variation of RVE size	156
5.6.14	Plasticity and damage - variation of fiber length	157
5.6.15	Plasticity and damage - contour plots	159
6	Discussion	161
6.1	Microstructural aspects	162
6.1.1	Fiber volume fraction	162
6.1.2	Fiber orientation distribution	162
6.1.3	Fiber length distribution	165
6.1.4	Correlation between fiber orientation and length distribution	165
6.1.5	Microstructure generation	166
6.2	Constitutive models	168
6.2.1	General aspects	168
6.2.2	Viscoelastic matrix model	170
6.2.3	Plastic matrix model	177
6.2.4	Fiber fracture model	179
6.2.5	Interface model	179
6.3	Multidirectional LFT structure	180
6.3.1	General aspects	180

6.3.2	Effects of RVE size	184
6.3.3	Effects of fiber length	188
6.3.4	Effects of the finite element mesh	192
6.3.5	Deformation and damage mechanisms	194
6.3.6	Current limitations and future developments	200
7	Conclusions	203
