| Preface             | VII |
| Abstract            | IX  |
| Kurzzusammenfassung | IX  |
| Contents            | XI  |

|                                                                                                                           |           |
|---------------------------------------------------------------------------------------------------------------------------|-----------|
| <b>1. Introduction and Objectives of the Research</b>                                                                     | <b>1</b>  |
| 1.1. Nano-revolution of biomedical science and reproductive biology                                                       | 1         |
| 1.2. Objectives and outline of the thesis                                                                                 | 3         |
| <b>2. Fundamental Background</b>                                                                                          | <b>5</b>  |
| 2.1. Gold and gold nanoparticles                                                                                          | 5         |
| 2.2. Optical aspects of gold nanoparticles and their imaging                                                              | 7         |
| 2.3. Toxicological aspects of gold nanoparticles                                                                          | 13        |
| 2.4. Gold nanoparticle-membrane interactions                                                                              | 19        |
| 2.5. Biological application areas of gold nanoparticles                                                                   | 25        |
| 2.6. Design criteria of gold nanoparticles                                                                                | 29        |
| 2.7. Fabrication of gold nanoparticles and AuNP bioconjugates                                                             | 31        |
| 2.7.1. Conventional fabrication methods                                                                                   | 31        |
| 2.7.2. Pulsed laser ablation in liquids                                                                                   | 33        |
| 2.8. Parameters affecting NP formation during PLAL                                                                        | 38        |
| 2.9. Bioconjugation of AuNPs <i>in situ</i> during PLAL                                                                   | 43        |
| 2.10. Parameters affecting nanobioconjugate formation and function                                                        | 47        |
| <b>3. Experimentals</b>                                                                                                   | <b>51</b> |
| 3.1. Experimental techniques and adopted laser systems                                                                    | 51        |
| 3.1.1. Pulsed laser ablation in liquids (PLAL)                                                                            | 51        |
| 3.1.2. Nanoparticle bioconjugation                                                                                        | 52        |
| 3.2. Analytical methods                                                                                                   | 52        |
| 3.2.1. Ultraviolet-visible (UV-vis) spectrophotometry                                                                     | 52        |
| 3.2.2. Fluorescence spectroscopy                                                                                          | 54        |
| 3.2.3. Fourier-Transform Infrared (FT-IR) spectroscopy                                                                    | 56        |
| 3.2.4. (Surface-enhanced) Raman Spectroscopy (SERS)                                                                       | 58        |
| 3.2.5. X-ray photoelectron spectroscopy (XPS)                                                                             | 60        |
| 3.2.6. Dynamic light scattering (DLS)                                                                                     | 62        |
| 3.2.7. Zeta potential                                                                                                     | 64        |
| 3.2.8. Electron microscopy, energy-dispersive X-ray spectroscopy (EDXS) and high-angle annular dark-field imaging (HAADF) | 67        |
| 3.2.9. Fluorescence & confocal laser scanning microscopy (FluM, CLSM)                                                     | 70        |
| 3.2.10. X-ray diffraction (XRD)                                                                                           | 72        |
| 3.2.11. Mössbauer spectroscopy                                                                                            | 74        |
| 3.2.12. Flow cytometry & fluorescence-activated cell sorting (FACS)                                                       | 76        |
| 3.3. Experimental procedures                                                                                              | 78        |
| 3.3.1. Nanoparticle fabrication, bioconjugation and processing                                                            | 78        |
| 3.3.2. Nanoparticle and nanobioconjugate characterization                                                                 | 86        |

|           |                                                                         |            |
|-----------|-------------------------------------------------------------------------|------------|
| 3.3.3.    | Cellular studies with NPs                                               | 95         |
| 3.3.4.    | Spermatozoa studies with NPs                                            | 101        |
| 3.3.5.    | Standard terminology in nanotechnology                                  | 102        |
| <b>4.</b> | <b>Results and Discussion</b>                                           | <b>105</b> |
| 4.1.      | Yield enhancement of PLAL method                                        | 105        |
| 4.1.1.    | Gold nanoparticle fabrication by laser ablation with ps pulses          | 106        |
| 4.1.1.1.  | Analysis of nanoparticle yield                                          | 106        |
| 4.1.1.2.  | Characterization of ps-LAL fabricated AuNPs                             | 108        |
| 4.1.1.3.  | Characterization of ps-LAL fabricated AuNP bioconjugates                | 109        |
| 4.1.1.4.  | Integrity of biomolecules after in situ conjugation                     | 112        |
| 4.1.1.5.  | Functionality of ps-LAL fabricated AuNP bioconjugates                   | 115        |
| 4.1.2.    | Increasing the concentration of PLAL-generated AuNPs                    | 117        |
| 4.1.2.1.  | Increasing the concentration by ultrafiltration                         | 117        |
| 4.1.2.2.  | Increasing the concentration by solvent evaporation                     | 122        |
| 4.1.3.    | Summary and discussion                                                  | 127        |
| 4.2.      | Considerations for the structure-function relationship                  | 130        |
| 4.2.1.    | Intrinsic parameters of AuNPs                                           | 131        |
| 4.2.1.1.  | Primary nanoparticle size                                               | 132        |
| 4.2.1.2.  | Nanoparticle charge                                                     | 141        |
| 4.2.2.    | Optimization of conjugation parameters                                  | 144        |
| 4.2.2.1.  | The surrounding medium                                                  | 145        |
| 4.2.2.2.  | Binding stability and functional group                                  | 151        |
| 4.2.2.3.  | Ligand amount and ligand net charge                                     | 157        |
| 4.2.2.4.  | Biomolecule length, dimension and binding orientation                   | 163        |
| 4.2.2.5.  | Bivalent functionalization and surface saturation                       | 174        |
| 4.2.2.6.  | Amphiphilic ligand nature                                               | 182        |
| 4.2.3.    | Summary and discussion                                                  | 191        |
| 4.3.      | Transfer of the <i>in situ</i> bioconjugation method to other materials | 196        |
| 4.3.1.    | Silicon and silicon-based nanoparticles                                 | 197        |
| 4.3.2.    | PLAL-generated SiNPs and SiNP bioconjugates                             | 198        |
| 4.3.3.    | Magnetic iron-based nanoparticles                                       | 204        |
| 4.3.4.    | PLAL-generation of MNPs and magnetic nanobioconjugates                  | 206        |
| 4.3.5.    | Summary and discussion                                                  | 212        |
| <b>5.</b> | <b>Summary and Conclusion</b>                                           | <b>215</b> |
| 5.1.      | Summary                                                                 | 215        |
| 5.2.      | Conclusion and Outlook                                                  | 218        |
| <b>6.</b> | <b>References</b>                                                       | <b>221</b> |
| <b>7.</b> | <b>Annex</b>                                                            | <b>243</b> |
