List of Figures	15
List of Tables	23
List of Formulas	23
Abbreviations	31
Glossary	35
1. Introduction	39
1.1 Background	39
1.2 Problem definition	40
1.3 Objective and procedure	41
2. Relevant developments in the residential sector and existing modelling approaches	43
2.1 Overview of the chapter	43
2.2 An empirical assessment of energy demand in the residential sector	44
2.2.1 Energy demand and drivers	44
2.2.2 Technological trends and relevant policies	49
2.3 Ex ante analysis of residential energy demand	54
2.4 Modelling approaches for residential energy demand	56
2.4.1 Introduction to modelling	56
2.4.2 Selection criteria for a suitable modelling approach	56
2.4.3 Characterisation of existing modelling approaches	57
2.4.4 Bottom-up modelling and selection of a suitable approach	60
2.5 Existing models focussing on very long-term energy analysis	65
2.6 Summary and research gap	67
	9

## *Contents*

3. Development of an integrated modelling concept for long-term energy demand analysis	69
3.1 Overview of the chapter	69
3.2 Introduction to the integrated modelling concept	69
3.3 Framework conditions and concept requirements	72
3.4 Hierarchical dimensions of the integrated modelling concept	73
3.5 Concept structure and procedure	75
4. Development of the End-Use Model	79
4.1 Overview of the chapter	79
4.2 Framework conditions and model requirements	80
4.3 Modelling structure and procedure	80
4.4 Selection of methodological approaches	85
4.4.1 Representation of innovation and diffusion	85
4.4.1.1 Introduction to innovation and diffusion modelling	85
4.4.1.2 Modelling innovation cycles	86
4.4.1.3 Modelling diffusion as an epidemic process	89
4.4.1.4 Modelling diffusion based on decision-making	91
4.4.2 Representation of the decreasing trend of investment costs	95
4.4.3 Representation of energy carrier price expectation	96
4.4.4 Representation of technology-related energy efficiency development	97
4.4.5 Representation of energy budget induced rebound effects	102
4.4.6 Representation of residual electricity demand	107
4.5 Simulation of final energy demand	112
4.5.1 Calculation of Module I	112
4.5.1.1 Calculation of ownership rates	112
4.5.1.2 Calculation of end-use stock transformation	116
4.5.1.3 Calculation of specific energy demand	120
4.5.1.4 Calculation of residual electricity demand	122

4.5.2	Calculation of Module II	124
4.5.2.1	Calculation of useful energy demand per building segment	124
4.5.2.2	Calculation of building stock transformation	131
4.5.2.3	Calculation of final energy demand and useful energy demand coverage of installed ventilation systems	135
4.5.2.4	Calculation of stock transformation of heating systems	137
4.5.2.5	Calculation of restrictions of heating system diffusion beyond the system boundaries of energy demand models	143
4.5.3	Calculation of final energy demand	149
4.5.4	Validation of the model	151
4.6	Methodological conclusions	154
4.6.1	Added value of the model	154
4.6.2	Opportunities for further research	156
5.	Development of the Transition Model	159
5.1	Overview of the chapter	159
5.2	Framework conditions and model requirements	160
5.3	Measures to quantify innovation activity	160
5.3.1	Comparison and selection of innovation measures	160
5.3.2	Critical discussion of patent applications as a measure of innovation	164
5.4	Modelling structure and procedure	166
5.5	Selection of methodological approaches	167
5.5.1	Development of a procedure for a patent-based concordance	167
5.5.2	Quantification of the pace of technological progress	169
5.5.2.1	Classification of indicators based on patents	169
5.5.2.2	Selection of an indicator based on patents	170
5.5.2.3	Discussion of studies applying the technology-cycle-time indicator	173

## Contents

5.6 Calculation of the end-use-specific depreciation of technological knowledge	177
5.6.1 Development of a concordance between the International Patent Classification scheme and end-uses	177
5.6.1.1 Concept development	177
5.6.1.2 Quantitative assessment	186
5.6.2 Calculation of the technology-cycle-time	187
5.6.2.1 Concept development	187
5.6.2.2 Quantitative assessment	189
5.6.3 Calculating the depreciation of technological knowledge	194
5.6.3.1 Concept development	194
5.6.3.2 Quantitative assessment	197
5.6.4 Validation of the model	199
5.7 Methodological conclusions	202
5.7.1 Added value of the model	202
5.7.2 Opportunities for further research	203
6. Development of the Energy Service Model	205
6.1 Overview of the chapter	205
6.2 Framework conditions and model requirements	206
6.3 Modelling structure and procedure	206
6.4 Selection of methodological approaches	210
6.4.1 Representation of decomposed energy demand by effects	210
6.4.2 Representation of long-term energy demand trends	214
6.5 Simulation of final energy demand	215
6.5.1 Decomposition analysis of empirical energy demand	215
6.5.2 Determination of explanatory variables	220
6.5.3 Discussion of alternative linear regression models and statistical testing methods	222
6.5.4 Extension of regression models to capture long-term elasticities	225
6.5.5 Calculation of Module I	226
6.5.5.1 Assignment of explanatory variables to decomposition effects	226

6.5.5.2	Selection of regression models	227
6.5.6	Calculation of Module II	230
6.5.6.1	Assignment of explanatory variables to decomposition effects	230
6.5.6.2	Selection of regression models	230
6.5.7	Calculation of final energy demand	234
6.5.8	Validation of the model	235
6.6	Methodological conclusions	237
6.6.1	Added value of the model	237
6.6.2	Opportunities for further research	237
7.	Development of the Integrated Demand Model	241
7.1	Overview of the chapter	241
7.2	Integration of models	242
7.2.1	Framework conditions and requirements of model coupling	242
7.2.2	Structure and procedure of the model integration	242
7.2.3	Modelling the transition from a technology-based to an energy service-based representation of energy demand	243
7.2.4	Modelling the impact of the technology-cycle-time on energy efficiency development	247
7.2.5	Calculation of final energy demand	250
7.2.6	Plausibility check of model coupling	250
7.3	Methodological conclusions	252
7.3.1	Added value of the integrated model	252
7.3.2	Opportunities for further research	253
8.	Analysis of long-term energy demand using the Integrated Demand Model	255
8.1	Overview of the chapter	255
8.2	Scenario analysis	255
8.2.1	Definition and parameters	255
8.2.1.1	Scenario definition	255
8.2.1.2	Socio-economic, price and climate parameters	257
8.2.1.3	Techno-economic parameters	259

## *Contents*

8.2.1.4	Energy service-related parameters	261
8.2.1.5	Technology-cycle-time	261
8.2.2	Results	264
8.2.2.1	Analysing energy demand based on the End-Use Model	264
8.2.2.2	Comparison of energy demand based on the End-Use Model and the Energy Service Model	267
8.2.2.3	Analysing energy demand based on the Integrated Demand Model	271
8.3	Sensitivity analysis	274
8.3.1	Definition	274
8.3.2	Results	275
8.3.2.1	Analysing the impact on energy demand of drivers essentially influencing technological knowledge	275
8.3.2.2	Analysing the impact on the technological knowledge stock of drivers essentially influencing technological knowledge	277
9.	Conclusions and outlook	281
9.1	Contributions to the scientific discussion	281
9.1.1	Recommendations to extend bottom-up models for the assessment of long-term scenarios by explicitly taking technological myopia into account	281
9.1.2	Implications of the newly developed concept for ex ante residential energy demand analysis	283
9.1.3	General limitations on the meaningfulness of bottom-up results due to technological myopia	285
9.2	Critical reflections	286
9.3	Outlook	289
10.	Summary	293
