Operators	x
 I Introduction	 1
 1 State of the art in immersed boundary methods	 5
1.1 Continuous forcing methods	5
1.2 Discrete forcing methods	6
1.2.1 Direct forcing methods	6
1.2.2 Ghost-cell methods	6
1.2.3 Cut-cell methods	7
 2 The granular flow model	 9
2.1 On the derivation of macroscopic conservation equations	10
2.2 Constitutive modelling	11
2.2.1 Granular temperature	11
2.2.2 Stress strain relation	12
2.2.3 Maximum volume fraction and compressibility factor	12
2.2.4 Kinetic and yield expressions	14
2.2.5 Boundary conditions	16
2.3 Overview on model equations	18
2.3.1 Convection and pressure	19
2.3.2 Diffusion	19
2.3.3 Viscous heating	20
2.3.4 Dissipation	20

II	Interpolated cut-cell method (ICCM)	21
3	Grid generation in the ICCM	25
3.1	Denominations required for the cut-cell grid	25
3.2	Grid creation methods	27
3.2.1	Underlying rectilinear mesh	28
3.2.2	Cutting procedure using Marching Cubes	28
3.2.3	Boundary layer grids	35
3.2.4	Voronoi grids	36
3.3	Merging	40
3.3.1	Stability criteria	40
3.3.2	Merging procedure	42
3.4	Volume and area calculations	46
4	Interpolation approaches in the ICCM	49
4.1	On the necessity of a non-trivial interpolation	50
4.1.1	Examples for occurring errors without sufficient interpolation . . .	50
4.1.2	Convergence analysis of the diffusion term	53
4.2	Introducing interpolation methods	56
4.2.1	Multi-linear interpolation	56
4.2.2	Polynomial interpolation	59
4.2.3	Barycentric interpolation	60
4.2.4	Mixed multi-linear/barycentric-linear interpolation	62
4.2.5	Local least squares gradient reconstruction	63
4.2.6	Natural neighbor interpolation	64
4.2.7	Inverse distance weighting/ (Modified) Shepard's method	65
4.3	Comparison of the interpolation methods	67
4.3.1	Requirements	67
4.3.2	Motivation for requirements	68
4.3.3	Fulfillment of the requirements	69
4.3.4	Conclusion	73
4.4	Application of the interpolated cut-cell method (ICCM) to the discretized granular model	73
4.4.1	Convection terms	73
4.4.2	Pressure term	74
4.4.3	Diffusion terms	75
4.4.4	Viscous heating	76
4.4.5	General cut-cell discretization	79

III Numerical results and conclusion	83
5 Numerical results	85
5.1 Generic fluid flow	86
5.1.1 Flow through a finite channel	86
5.1.2 Circle area	88
5.1.3 Periodic test case	88
5.1.4 Influence of lower bounds on volume of interior cells	93
5.2 Granular flow model	94
5.2.1 Rotating cylinder	95
5.2.2 Shear plate	96
5.2.3 Continuous Immersed Boundary method	104
5.3 Industrial examples	106
5.3.1 Heap flow	106
5.3.2 Filling of a rotating cylinder	109
5.3.3 Voronoi grid with boundary layers	111
6 Conclusion	113
Appendix	117
A Continuous immersed boundary methods	117
A.1 Elastic boundaries	119
A.2 Rigid body	119
Bibliography	121
