Contents

Preface — v

About the Authors — vii

List of symbols — ix

1 Heat of detonation — 1
1.1 Basic knowledge of the heat of detonation — 1
1.1.1 Measurement of the heat of explosion — 2
1.1.2 Heat of detonation and heat of formation — 3
1.1.3 Relationship between the heat of combustion and heat of formation — 5
1.2 The assumed detonation products — 6
1.2.1 Simple methods for the prediction of the detonation products — 6
1.2.2 Prediction of the detonation products on the basis of computer codes and using quantum mechanical calculations for the prediction of Q_{det} — 10
1.3 New empirical methods for the prediction of Q_{det} without considering the detonation products — 11
1.3.1 Using the gas and condensed phase heats of formation of explosives — 11
1.3.2 Using structural parameters of high explosives — 14
1.3.3 Prediction of the heat of explosion in double-base and composite Modified double-base propellants — 15

2 Detonation temperature — 19
2.1 Adiabatic combustion (flame) temperature — 19
2.1.1 Combustion of fuels with air — 19
2.1.2 Combustion of propellants — 21
2.2 Detonation (explosion) temperature for explosives — 22
2.2.1 Measurement of detonation temperature — 22
2.2.2 Calculation of detonation temperature — 24

3 Detonation velocity — 31
3.1 Chapman–Jouguet (C–J) theory and detonation performance — 31
3.2 Ideal and nonideal explosives — 32
3.3 Measurement of the detonation velocity — 34
3.4 Prediction of the detonation velocity of ideal explosives — 36

Bibliografische Informationen
http://d-nb.info/1124791671

digitalisiert durch DEUTSCHE NATIONAL BIBLIOTHEK

3.4.1 Detonation velocity as a function of the loading density, element composition, and the condensed phase heat of formation of pure and composite explosives — **37**
3.4.2 Detonation velocity as a function of the loading density, element composition, and the gas phase heat of formation of the pure component — **39**
3.4.3 Detonation velocity as a function of the loading density and molecular structures of high explosives — **39**
3.4.4 Maximum attainable detonation velocity — **40**
3.4.5 Comparison of empirical correlations with computer codes — **41**
3.5 Estimation of the detonation velocity of nonideal explosives — **45**
3.5.1 Detonation velocity of ideal and nonideal explosives as a function of the loading density, element composition, and the condensed phase heat of formation of pure or composite explosives — **45**
3.5.2 Using molecular structure to predict the detonation velocity of ideal and nonideal explosives — **48**
3.5.3 Maximum attainable detonation velocity of $C_aH_bN_cO_dF_e$ and aluminized explosives — **49**

4 Detonation pressure — 55
4.1 Relationship between the detonation pressure and the detonation velocity — **55**
4.2 Measurement of the detonation pressure — **58**
4.3 Estimation of the detonation pressure of ideal explosives — **58**
4.3.1 Detonation pressure as a function of the loading density, element composition, and the condensed phase heat of formation of pure or composite explosives — **58**
4.3.2 Detonation pressure as a function of the loading density, element composition and gas phase heat of formation of the pure component — **60**
4.3.3 Detonation pressure as a function of the loading density and molecular structure of high explosives — **60**
4.3.4 Maximum attainable detonation pressure — **61**
4.4 Prediction of the detonation pressure of nonideal aluminized explosives — **61**
4.4.1 Using the elemental composition for predicting the detonation pressure of explosives — **62**
4.4.2 Detonation pressure of $C_aH_bN_cO_dF_eCl_f$ and aluminized explosives as a function of the loading density, element composition, and the condensed phase heat of formation of pure or composite explosives — **63**

4.4.3 Using molecular structure for predicting the detonation pressure of ideal and aluminized explosives — 64
4.4.4 Maximum attainable detonation pressure of $C_aH_bN_cO_dF_e$ explosives and aluminized explosives — 65

5 Gurney energy — 69
5.1 Gurney energy and Gurney velocity — 69
5.2 Gurney energy and the cylinder expansion test — 70
5.2.1 Cylinder test measurements — 71
5.2.2 Prediction methods of the cylinder test — 71
5.2.3 JWL equation of state — 73
5.3 Different methods for the prediction of the Gurney velocity — 74
5.3.1 Using the Kamlet–Jacobs decomposition products — 74
5.3.2 The use of elemental composition and the heat of formation — 75
5.3.3 The use of elemental composition without using the heat of formation of an explosive — 76

6 Power (strength) — 79
6.1 Different methods for measuring the power and brisance of an explosive — 80
6.2 Different methods for the prediction of power — 82
6.2.1 A simple correlation for the prediction of the volume of explosion gases of energetic compounds — 82
6.2.2 Power index — 83
6.2.3 Simple correlations for the prediction of power on the basis of the Trauzl lead block and the ballistic mortar tests — 84
6.3 Prediction of brisance — 88
6.3.1 Prediction of f^+_{brisance} and f^-_{brisance} for pure energetic materials — 89
6.3.2 Brisance for mixtures and aluminized explosives — 90

Answers to Questions and Problems — 93

Appendix: Glossary of compound names and heats of formation for pure and composite explosives — 97

References — 103

Index — 109
