

Table of contents

Foreword	9
I. Genes and society	
A silent cognitive revolution	11
Well meant	12
Mentally disabled, even before birth?	13
Three times 21	14
Has our society decided?	15
Down's Heritage	17
47 chromosomes rather than 46	18
Mutations	19
Eugenics, compulsory sterilization and euthanasia	20
Fear of low IQ	22
Genetics and epigenetics	23
A picture is worth a thousand words	24
Summary	26
II. The brain and intelligence	
Head size and intelligence tests	27
IQ as gatekeeper	29
Why being different is normal	30
Am I stupid?	32
Genes for brain growth or stress in early childhood?	33
Brain growth and evolution	35
Birdbrained geniuses	36
The human brain is a social tool	37
The brain as a learning tool	39
Accelerating thinking through abstraction	40
Mouse memory	41
The seat of learning	43
Memory is distributed across the brain	45
Summary	46

III. Neurotransmitters and neuroenhancement	
Enzymes: catalysts in the brain	48
Acetylcholine and the fear of Alzheimer's	50
Donepezil: doping for the brain	52
How the brain neutralizes medication	54
Dopamine: addictive stimulation	55
Glutamate: more than just a matter of taste	57
Memantine: hope for a learning pill	58
GABA: inhibit inhibition	60
Basmisanil: release the brakes in the brain	61
Brain doping: cleverer by prescription?	62
Neuroenhancement or essential drug?	64
Summary	65
IV. Neurodiversity and attention	
Serotonin, an endogenous antidepressant	66
Oxytocin: cuddling depression away	68
Norepinephrine: rock 'n' roll in the brain	69
Humans are different and mice too	71
Neurodiversity instead of neurodegeneration	72
Removing the fear of aging	74
Studying at university with trisomy 21?	75
Learning from rabbis and nuns	76
Segregation already begins with speech	78
Empathy for neurodiversity	79
Motor learning and the 21st chromosome	81
Acetylcholine in the striate body	83
Emotion and the 21st chromosome	84
Short-term memory and the 21st chromosome	86
Learning in sleep	88
At the focal point of the stream of thoughts	90
The bifurcation diagram: calculation and hypothesis	92
Summary	95
V. Attention and memory	
Navon figures	96
The overall shape and details	99
Dice-pip and interference images	102
Abstraction means "draw away from ..."	106

The scope of attention	109
The magical number four	110
Measuring the scope of attention	112
Memory and matching pairs	116
Reveal the numbers in sequence	120
Object permanence	122
Observe and remember causalities	123
Abstract thought in the pushchair	126
Mouse and duck theater	127
Supersigns and abstraction	131
Summary	133

VI. Imitation and motor learning

Alfred Christoph Röhm

Juggling in a small attention window	135
Auditory and haptic scope of attention	136
Proprioception – endogenous perception	138
Scope of attention for proprioception	140
Body percussion	141
Successful imitation depends on the number of micromotions	143
Dialogic learning requires creativity	144
Summary	145

VII. Speech and thought

Kim Lena Hurtig-Bohn

The window to a child's head	147
The prefrontal cortex and private speech	148
The development of private speech in childhood	150
Private speech in pedagogy	151
The zone of proximal development	152
Private speech and trisomy 21	153
Private speech in autism spectrum disorders	155
Summary	156

VIII. Cognitive development and mathematics

Torben Rieckmann

Trisomy 21 and mathematics?	158
Trisomy 21 and dyscalculia	159
Clustering and supersigns	161
The power of five	165
Deliberately use teaching materials	167

Appropriate visual aids	170
Summary	174

IX. Communication and emotion

Angela Kalmutzke

It's great that you have a child with Down syndrome!	175
Respect for the essence of and confidence in learning ability	177
On life and death	179
Late termination of pregnancy	181
Opting for life	183
The social matrix	184
Behavioral problems today, personality disorders tomorrow?	188
Promoting self-worth	191
Summary	195

Afterword	196
