|----------|-----------------------------------------------------------------------------|-----------|
| <b>1</b> | <b>Introduction</b>                                                         | <b>7</b>  |
| <b>2</b> | <b>Description of the asymmetric field-flow fractionation</b>               | <b>9</b>  |
| <b>3</b> | <b>Preliminaries</b>                                                        | <b>11</b> |
| <b>4</b> | <b>The optimal control problem</b>                                          | <b>15</b> |
| 4.1      | The Stokes–Brinkman equation . . . . .                                      | 15        |
| 4.2      | The advection-diffusion equation . . . . .                                  | 18        |
| 4.3      | The optimization problem . . . . .                                          | 19        |
| <b>5</b> | <b>Discretization in space</b>                                              | <b>21</b> |
| 5.1      | The finite element method . . . . .                                         | 21        |
| 5.2      | Finite element discretization of the Stokes–Brinkman equation . . . . .     | 25        |
| 5.3      | Finite element discretization of the advection-diffusion equation . . . . . | 28        |
| 5.4      | Spatial discretization of the optimal control problem . . . . .             | 29        |
| <b>6</b> | <b>Existence of a minimizer</b>                                             | <b>31</b> |
| 6.1      | Solvability of the semi-discretized Stokes–Brinkman equation . . . . .      | 32        |
| 6.2      | Solvability of the semi-discretized advection-diffusion equation . . . . .  | 38        |
| 6.3      | The existence of a minimizer . . . . .                                      | 40        |
| 6.4      | Differentiability of the solution operators . . . . .                       | 43        |
| <b>7</b> | <b>Lagrange framework and first-order necessary optimality conditions</b>   | <b>55</b> |
| 7.1      | Preparations . . . . .                                                      | 55        |
| 7.2      | Introduction of an auxiliary system . . . . .                               | 60        |
| 7.3      | Existence of Lagrange multipliers . . . . .                                 | 62        |
| 7.4      | The first-order optimality conditions for the auxiliary problem . . . . .   | 65        |
| 7.5      | First-order optimality conditions for the original problem . . . . .        | 69        |
| 7.6      | The gradient method . . . . .                                               | 73        |
| 7.7      | Error estimation . . . . .                                                  | 74        |
| <b>8</b> | <b>Model order reduction</b>                                                | <b>77</b> |
| 8.1      | Model reduction by tangential interpolation . . . . .                       | 77        |
| 8.1.1    | Iterative rational Krylov algorithm . . . . .                               | 79        |
| 8.1.2    | IRKA for the Stokes–Brinkman equation . . . . .                             | 80        |

|          |                                                                       |            |
|----------|-----------------------------------------------------------------------|------------|
| 8.2      | Balanced truncation . . . . .                                         | 83         |
| 8.2.1    | Balanced truncation for linear time-invariant systems . . . . .       | 83         |
| 8.2.2    | Balanced truncation for the Stokes–Brinkman equation . . . . .        | 84         |
| 8.2.3    | Balanced truncation for systems with many inputs or outputs . . . . . | 88         |
| 8.3      | POD for model reduction of nonlinear equations . . . . .              | 90         |
| 8.3.1    | Problem formulation and snapshots . . . . .                           | 91         |
| 8.3.2    | Optimal solution by SVD . . . . .                                     | 92         |
| 8.3.3    | Model reduction by projection . . . . .                               | 92         |
| 8.3.4    | Discrete empirical interpolation method . . . . .                     | 93         |
| 8.3.5    | Matrix DEIM . . . . .                                                 | 95         |
| 8.3.6    | Model reduction for the advection-diffusion equation . . . . .        | 98         |
| 8.4      | The reduced gradient method . . . . .                                 | 99         |
| <b>9</b> | <b>Numerical experiments</b>                                          | <b>101</b> |
| 9.1      | Model reduction results . . . . .                                     | 101        |
| 9.1.1    | Stokes–Brinkman equation and its adjoint . . . . .                    | 101        |
| 9.1.2    | The advection-diffusion equation and its adjoint . . . . .            | 101        |
| 9.2      | The optimal control problem . . . . .                                 | 104        |
