Foreword — VII

1	Introduction. Current challenges in space exploration — 1
1.1	Accessible space — 1
1.2	Distributed space systems — 3
1.3	Efficient orbit transfers — 4
1.3.1	Low-thrust missions — 5
1.3.2	Solar sailing — 6
1.3.3	Gravity-assist trajectories — 6
1.4	Orbit propagation — 7
1.5	The aim of the present book — 9

Part I: Regularization

2	Theoretical aspects of regularization — 13
2.1	Why bother? — 14
2.2	The Sundman transformation — 17
2.2.1	Generalized Sundman transformation — 19
2.2.2	Time transformations in N -body systems — 22
2.3	Stabilization of the equations of motion — 24
2.4	Linearization — 27
2.4.1	Levi-Civita variables — 28
2.4.2	Cartesian coordinates — 30
2.4.3	Universal solutions — 31
2.5	Sets of orbital elements — 33
2.6	Canonical transformations — 37
2.7	Gauge freedom in celestial mechanics — 42
2.8	Conclusions — 45
3	The Kustaanheimo–Stiefel space and the Hopf fibration — 47
3.1	The need for an extra dimension: Fibrations of hyperspheres — 49
3.2	The KS transformation as a Hopf map — 51
3.2.1	Defining the fibers — 52
3.2.2	The velocity and the bilinear relation — 54
3.2.3	The two-body problem — 55
3.2.4	The inverse mapping — 56
3.3	Stability in KS space — 57
3.3.1	A central theorem — 58

3.3.2	The fundamental manifold Γ —	59
3.3.3	Fixed points, limit cycles, and attractors —	59
3.3.4	Relative dynamics and synchronism —	60
3.3.5	Stability of the fundamental manifold —	61
3.4	Order and chaos —	63
3.4.1	The $\mathcal{H}$ -separation —	64
3.4.2	Topological stability —	65
3.5	Topological stability in N -body problems —	66
3.5.1	The Pythagorean three-body problem —	67
3.5.2	Field stars interacting with a stellar binary —	69
3.6	Gauge-generalized elements in KS space —	72
3.6.1	Natural sets of elements: Geometrical interpretation —	72
3.6.2	Gauge freedom in KS space —	78
3.7	Orthogonal bases —	80
3.7.1	Basis attached to the fiber —	80
3.7.2	Cross product —	81
3.8	Conclusions —	82
4	The Dromo formulation —	84
4.1	Hansen ideal frames —	85
4.2	Dromo —	86
4.2.1	The eccentricity vector —	88
4.2.2	The orbital plane —	89
4.2.3	Evolution equations —	90
4.3	Improved performance —	92
4.4	Variational equations and the noncanonicity of Dromo —	95
4.5	Gauge-generalized Dromo formulation —	97
4.6	Singularities —	98
4.7	Conclusions —	99
5	Dedicated formulation: Propagating hyperbolic orbits —	101
5.1	Orbital motion —	103
5.1.1	The eccentricity vector —	104
5.1.2	The hyperbolic anomaly —	107
5.2	Hyperbolic rotations and the Lorentz group —	108
5.3	Variation of parameters —	109
5.3.1	The new independent variable —	109
5.3.2	Evolution equations —	113
5.4	Orbital plane dynamics —	115
5.5	Time element —	116
5.6	Numerical evaluation —	119
5.6.1	Hyperbolic comets —	120

5.6.2	Geocentric flybys — 123
5.7	Conclusions — 126
6	Evaluating the numerical performance — 127
6.1	Implementation — 128
6.1.1	Force models — 128
6.1.2	Formulations — 129
6.1.3	Numerical integration — 131
6.1.4	Variational equations — 131
6.2	Evaluating the performance — 132
6.2.1	Problem 1 — 133
6.2.2	Problem 2 — 137
6.3	Conclusions — 140

Part II: Applications

7	The theory of asynchronous relative motion — 143
7.1	Definition of the problem — 146
7.2	Synchronism in relative motion — 146
7.2.1	Time-synchronous approach — 148
7.2.2	Asynchronous approach — 148
7.2.3	A simple example — 153
7.2.4	Improving the accuracy with second-order corrections of the time delay — 155
7.3	Generalizing the transformation — 157
7.3.1	The time delay using equinoctial orbital elements — 157
7.3.2	Connection with the time-synchronous solution — 161
7.4	The circular case — 162
7.4.1	Second-order correction — 164
7.5	Numerical evaluation — 165
7.5.1	Keplerian motion — 166
7.5.2	Perturbed motion — 167
7.6	Conclusions — 171
8	Universal and regular solutions to relative motion — 172
8.1	Relative motion in Dromo variables — 174
8.2	Relative motion in Sperling–Burdet variables — 177
8.3	Relative motion in Kustaanheimo–Stiefel variables — 181
8.3.1	Summary — 183
8.4	On the fictitious time — 183
8.5	Numerical examples — 184

8.6	Generic propagation of the variational equations —	189
8.6.1	Initializing the independent variable —	191
8.6.2	The time element —	192
8.7	Conclusions —	194

9 Generalized logarithmic spirals: A new analytic solution with continuous thrust — 195

9.1	The equations of motion. First integrals —	198
9.1.1	The equation of the energy —	200
9.1.2	The equation of the angular momentum —	201
9.1.3	The flight direction angle ψ —	202
9.1.4	The fundamental theorem of curves —	203
9.1.5	Families of solutions —	205
9.1.6	Form of the solution —	206
9.2	Elliptic spirals ($K_1 < 0$) —	207
9.2.1	The trajectory —	208
9.2.2	The time of flight —	210
9.3	Parabolic spirals ($K_1 = 0$) —	211
9.3.1	The trajectory —	212
9.3.2	The time of flight —	213
9.4	Hyperbolic spirals ($K_1 > 0$) —	213
9.4.1	Type I hyperbolic spirals —	215
9.4.2	Type II hyperbolic spirals —	217
9.4.3	Transition between Type I and Type II spirals —	220
9.5	Summary —	222
9.6	Osculating elements —	222
9.7	In-orbit departure point —	225
9.8	Practical considerations —	228
9.9	Continuity of the solution —	229
9.9.1	Elliptic to parabolic —	230
9.9.2	Hyperbolic to parabolic —	230
9.9.3	Asymptotic limit from Type I hyperbolic spirals —	230
9.9.4	Asymptotic limit from Type II hyperbolic spirals —	231
9.10	Conclusions —	231

10 Lambert's problem with generalized logarithmic spirals — 233

10.1	Introduction to Lambert's problem —	233
10.2	Controlled generalized logarithmic spirals —	235
10.3	The two-point boundary-value problem —	239
10.3.1	The minimum-energy spiral —	240
10.3.2	Conjugate spirals —	242
10.3.3	Families of solutions —	242

10.3.4	The thrust acceleration —	245
10.3.5	The Δv due to the thrust —	247
10.3.6	The locus of velocities —	247
10.4	Fixing the time of flight —	248
10.5	Repetitive transfers —	250
10.6	Evaluating the performance —	252
10.7	Additional properties —	254
10.8	Additional dynamical constraints —	255
10.8.1	Arrival conditions —	256
10.8.2	Radius —	256
10.8.3	Eccentricity —	257
10.8.4	Semimajor axis —	258
10.8.5	Periapsis and apoapsis radii —	258
10.9	Conclusions —	259
11	Low-thrust trajectory design with controlled generalized logarithmic spirals —	261
11.1	Orbit transfers —	262
11.1.1	Bitangent transfers —	262
11.1.2	Transfers between arbitrary orbits. Introducing coast arcs —	266
11.1.3	Existence of solutions. The admissible region —	270
11.1.4	Controlling the time of flight —	271
11.2	Periodic orbits —	272
11.2.1	Coaxial solutions —	272
11.2.2	Generic periodic orbits —	273
11.3	Multinode transfers —	275
11.4	Three-dimensional motion —	276
11.4.1	The thrust acceleration —	280
11.4.2	Modeling the out-of-plane motion —	280
11.4.3	Transfers between arbitrary orbits —	285
11.5	Applications —	286
11.5.1	Simplified model —	287
11.5.2	Real ephemeris —	290
11.6	Conclusions —	292
12	Nonconservative extension of Keplerian integrals and new families of orbits —	293
12.1	The role of first integrals —	293
12.2	Dynamics —	296
12.2.1	Similarity transformation —	297
12.2.2	Integrals of motion and dynamical symmetries —	298
12.2.3	Properties of the similarity transformation —	301

12.2.4	Solvability — 302
12.3	Case $\gamma = 1$: Conic sections — 303
12.4	Case $\gamma = 2$: Generalized logarithmic spirals — 304
12.5	Case $\gamma = 3$: Generalized cardioids — 304
12.5.1	Elliptic motion — 304
12.5.2	Parabolic motion: The cardioid — 306
12.5.3	Hyperbolic motion — 306
12.6	Case $\gamma = 4$: Generalized sinusoidal spirals — 310
12.6.1	Elliptic motion — 311
12.6.2	Parabolic motion: Sinusoidal spiral (off-center circle) — 313
12.6.3	Hyperbolic motion — 314
12.7	Summary — 316
12.8	Unified solution in Weierstrassian formalism — 316
12.9	Physical discussion of the solutions — 318
12.9.1	Connection with Schwarzschild geodesics — 318
12.9.2	Newton's theorem of revolving orbits — 320
12.9.3	Geometrical and physical relations — 321
12.10	Conclusions — 322

13 Conclusions — 324

Part III: Appendices

A	Hypercomplex numbers — 329
A.1	Complex and hyperbolic numbers — 330
A.1.1	The modulus — 331
A.1.2	The geometry of two-dimensional hypercomplex numbers — 332
A.1.3	Angles and rotations — 332
A.2	Quaternions — 333
A.2.1	Rotations in $\mathbb{R}^3$ — 334
A.2.2	Quaternion dynamics — 334
B	Formulations in PERFORM — 336
C	Stumpff functions — 339
D	Inverse transformations — 343
D.1	Inverse transformations in equinoctial variables — 343
D.1.1	Asynchronous case — 343
D.1.2	Synchronous case — 344

D.2	Cartesian to Dromo —	345
D.3	Linear form of the Hopf fibration —	346
E	Elliptic integrals and elliptic functions —	348
E.1	Properties and practical relations —	349
E.1.1	Reciprocal-modulus transformation —	349
E.1.2	Imaginary-argument transformation —	350
E.1.3	Imaginary-modulus transformation —	350
E.2	Implementation —	350
E.2.1	Intrinsic functions —	350
E.2.2	Approximation —	352
E.3	Jacobi elliptic functions —	352
E.4	Weierstrass elliptic functions —	354
F	Controlled generalized logarithmic spirals —	356
F.1	Elliptic spirals —	357
F.1.1	The time of flight —	359
F.2	Parabolic spirals —	359
F.2.1	The time of flight —	360
F.3	Hyperbolic spirals —	361
F.3.1	Hyperbolic spirals of Type I —	361
F.3.2	Hyperbolic spirals of Type II —	362
F.3.3	Limit case $K_2 = 2(1 - \xi)$ —	364
F.4	Osculating elements —	365
G	Dynamics in Seiffert's spherical spirals —	366
G.1	Dynamics —	366
G.1.1	The accelerated two-body problem —	368
G.1.2	Integrals of motion —	370
G.1.3	The osculating orbit —	371
G.2	The geometry of Seiffert's spherical spirals —	372
G.3	Groundtracks —	374
G.4	Relative motion between Seiffert's spirals —	376
G.5	The significance of Seiffert's spirals —	377

List of Figures — 379
