Foreword — V

Preface — VII

1 Introduction to fractional calculus and fractional-order control — 1

- 1.1 Historical review of fractional calculus — 1
- 1.2 Fractional modelling in the real world — 3
- 1.3 Introduction to fractional-order control tools — 5
- 1.4 Structure of the book — 6
 - 1.4.1 Outlines of the book — 6
 - 1.4.2 A guide of reading the book — 7

2 Mathematical prerequisites — 9

- 2.1 Elementary special functions — 9
 - 2.1.1 Error and complementary error functions — 10
 - 2.1.2 Gamma functions — 11
 - 2.1.3 Beta functions — 15
- 2.2 Dawson function and hypergeometric functions — 18
 - 2.2.1 Dawson function — 18
 - 2.2.2 Hypergeometric functions — 20
- 2.3 Mittag-Leffler functions — 23
 - 2.3.1 Mittag-Leffler functions with one parameter — 23
 - 2.3.2 Mittag-Leffler functions with two parameters — 26
 - 2.3.3 Mittag-Leffler functions with more parameters — 30
 - 2.3.4 Derivatives of Mittag-Leffler functions — 30
 - 2.3.5 Numerical evaluation of Mittag-Leffler functions and their derivatives — 33
- 2.4 Some linear algebra techniques — 34
 - 2.4.1 Kronecker product and Kronecker sum — 35
 - 2.4.2 Matrix inverse — 35
 - 2.4.3 Arbitrary matrix function evaluations — 38
- 2.5 Numerical optimisation problems and solutions — 40
 - 2.5.1 Unconstrained optimisation problems and solutions — 40
 - 2.5.2 Constrained optimisation problems and solutions — 41
 - 2.5.3 Global optimisation solutions — 44
- 2.6 Laplace transform — 47
 - 2.6.1 Definitions and properties — 47
 - 2.6.2 Computer solutions to Laplace transform problems — 48

3	Definitions and computation algorithms of fractional-order derivatives and integrals — 51
3.1	Fractional-order Cauchy integral formula — 52
3.1.1	Cauchy integral formula — 52
3.1.2	Fractional-order derivative and integral formula for commonly used functions — 53
3.2	Grünwald–Letnikov definition — 53
3.2.1	Deriving high-order derivatives — 53
3.2.2	Grünwald–Letnikov definition in fractional calculus — 54
3.2.3	Numerical computation of Grünwald–Letnikov derivatives and integrals — 54
3.2.4	Podlubny’s matrix algorithm — 61
3.2.5	Studies on short-memory effect — 62
3.3	Riemann–Liouville definition — 66
3.3.1	High-order integrals — 66
3.3.2	Riemann–Liouville fractional-order definition — 66
3.3.3	Riemann–Liouville formula of commonly used functions — 67
3.3.4	Properties of initial time translation — 68
3.3.5	Numerical implementation of the Riemann–Liouville definition — 69
3.4	High-precision computation algorithms of fractional-order derivatives and integrals — 70
3.4.1	Construction of generating functions with arbitrary orders — 71
3.4.2	FFT-based algorithm — 74
3.4.3	A new recursive formula — 76
3.4.4	A better fitting at initial instances — 80
3.4.5	Revisit to the matrix algorithm — 85
3.5	Caputo definition — 86
3.6	Relationships between different definitions — 87
3.6.1	Relationship between Grünwald–Letnikov and Riemann–Liouville definitions — 88
3.6.2	Relationships between Caputo and Riemann–Liouville definitions — 88
3.6.3	Computation of Caputo fractional-order derivatives — 89
3.6.4	High-precision computation of Caputo derivatives — 91
3.7	Properties of fractional-order derivatives and integrals — 93
3.7.1	Properties — 93
3.7.2	Geometric and physical interpretations of fractional-order integrals — 95
4	Solutions of linear fractional-order differential equations — 99
4.1	Introduction to linear fractional-order differential equations — 99
4.1.1	General form of linear fractional-order differential equations — 100

4.1.2	Initial value problems of fractional-order derivatives under different definitions — 100
4.1.3	An important Laplace transform formula — 102
4.2	Analytical solutions of some fractional-order differential equations — 103
4.2.1	One-term differential equations — 103
4.2.2	Two-term differential equations — 103
4.2.3	Three-term differential equations — 104
4.2.4	General n -term differential equations — 105
4.3	Analytical solutions of commensurate-order differential equations — 106
4.3.1	General form of commensurate-order differential equations — 106
4.3.2	Some commonly used Laplace transforms in linear fractional-order systems — 107
4.3.3	Analytical solutions of commensurate-order equations — 109
4.4	Closed-form solutions of linear fractional-order differential equations with zero initial conditions — 113
4.4.1	Closed-form solution — 113
4.4.2	The matrix-based solution algorithm — 117
4.4.3	High-precision closed-form algorithm — 119
4.5	Numerical solutions to Caputo differential equations with nonzero initial conditions — 121
4.5.1	Mathematical description of Caputo equations — 121
4.5.2	Taylor auxiliary algorithm — 121
4.5.3	High-precision algorithm — 124
4.6	Numerical solutions of irrational system equations — 130
4.6.1	Irrational transfer function expression — 130
4.6.2	Simulation with numerical inverse Laplace transforms — 131
4.6.3	Closed-loop irrational system response evaluation — 133
4.6.4	Stability assessment of irrational systems — 134
4.6.5	Numerical Laplace transform — 138
5	Approximation of fractional-order operators — 141
5.1	Some continued fraction-based approximations — 142
5.1.1	Continued fraction approximation — 142
5.1.2	Carlson's method — 145
5.1.3	Matsuda–Fujii filter — 147
5.2	Oustaloup filter approximations — 149
5.2.1	Ordinary Oustaloup approximation — 149
5.2.2	A modified Oustaloup filter — 155
5.3	Integer-order approximations of fractional-order transfer functions — 157

5.3.1	High-order approximations —	157
5.3.2	Low-order approximation via optimal model reduction techniques —	161
5.4	Approximations of irrational models —	165
5.4.1	Frequency response fitting approach —	166
5.4.2	Charef approximation —	168
5.4.3	Optimised Charef filters for complicated irrational models —	173
6	Modelling and analysis of multivariable fractional-order transfer function matrices —	179
6.1	FOTF — Creation of a MATLAB class —	180
6.1.1	Defining FOTF class —	180
6.1.2	Display function programming —	182
6.1.3	Multivariable FOTF matrix support —	184
6.2	Interconnections of FOTF blocks —	185
6.2.1	Multiplications of FOTF blocks —	185
6.2.2	Adding FOTF blocks —	187
6.2.3	Feedback function —	188
6.2.4	Other supporting functions —	190
6.2.5	Conversions between FOTFs and commensurate-order models —	193
6.3	Properties of linear fractional-order systems —	195
6.3.1	Stability analysis —	195
6.3.2	Partial fraction expansion and stability assessment —	198
6.3.3	Norms of fractional-order systems —	199
6.4	Frequency domain analysis —	201
6.4.1	Frequency domain analysis of SISO systems —	201
6.4.2	Stability assessment with Nyquist plots —	203
6.4.3	Diagonal dominance analysis —	204
6.4.4	Frequency response evaluation under complicated structures —	207
6.4.5	Singular value plots in multivariable systems —	210
6.5	Time domain analysis —	211
6.5.1	Step and impulse responses —	211
6.5.2	Time responses under arbitrary input signals —	215
6.6	Root locus for commensurate-order systems —	217
7	State space modelling and analysis of linear fractional-order systems —	221
7.1	Standard representation of state space models —	221
7.2	Descriptions of fractional-order state space models —	222
7.2.1	Class design of FOSS —	222
7.2.2	Conversions between FOSS and FOTF objects —	224
7.2.3	Model augmentation under different base orders —	226

7.2.4	Interconnection of FOSS blocks —	227
7.3	Properties of fractional-order state space models —	231
7.3.1	Stability assessment —	231
7.3.2	State transition matrices —	232
7.3.3	Controllability and observability —	235
7.3.4	Controllable and observable staircase forms —	235
7.3.5	Norm measures —	236
7.4	Analysis of fractional-order state space models —	237
7.5	Extended fractional state space models —	238
7.5.1	Extended linear fractional-order state space models —	238
7.5.2	Nonlinear fractional-order state space models —	240
8	Numerical solutions of nonlinear fractional-order differential equations —	243
8.1	Numerical solutions of nonlinear Caputo equations —	243
8.1.1	Numerical solutions of single-term equations —	244
8.1.2	Solutions of multi-term equations —	249
8.1.3	Numerical solutions of extended fractional-order state space equations —	252
8.1.4	Equation solution-based algorithm —	256
8.2	Efficient high-precision algorithms for Caputo equations —	258
8.2.1	Predictor equation —	258
8.2.2	Corrector equation —	261
8.2.3	High-precision matrix algorithm for implicit Caputo equations —	263
8.3	Simulink block library for typical fractional-order components —	265
8.3.1	FOTF block library —	265
8.3.2	Implementation of FOTF matrix block —	270
8.3.3	Numerical solutions of control problems with Simulink —	272
8.3.4	Validations of Simulink results —	275
8.4	Block diagram-based solutions of fractional-order differential equations with zero initial conditions —	275
8.5	Block diagram solutions of nonlinear Caputo differential equations —	282
8.5.1	Design of a Caputo operator block —	282
8.5.2	Typical procedures in modelling Caputo equations —	284
8.5.3	Simpler block diagram-based solutions of Caputo equations —	286
8.5.4	Numerical solutions of implicit fractional-order differential equations —	291
9	Design of fractional-order PID controllers —	293
9.1	Introduction to fractional-order PID controllers —	293
9.2	Optimum design of integer-order PID controllers —	295

9.2.1	Tuning rules for FOPDT plants —	295
9.2.2	Meaningful objective functions for servo control —	297
9.2.3	OptimPID: An optimum PID controller design interface —	300
9.3	Fractional-order PID controller design with frequency response approach —	302
9.3.1	General descriptions of the frequency domain design specifications —	303
9.3.2	Design of $PI^\lambda D^\mu$ controllers for FOPDT plants —	304
9.3.3	Controller design with FOIDPT plants —	308
9.3.4	Design of $PI^\lambda D^\mu$ for typical fractional-order plants —	310
9.3.5	Design of PID^μ controllers —	311
9.3.6	Design of FO-[PD] controllers —	311
9.3.7	Other considerations on controller design —	312
9.4	Optimal design of $PI^\lambda D^\mu$ controllers —	312
9.4.1	Optimal $PI^\lambda D^\mu$ controller design —	312
9.4.2	Optimal $PI^\lambda D^\mu$ controller design for plants with delays —	317
9.4.3	OptimFOPID: An optimal fractional-order PID controller design interface —	320
9.5	Design of fuzzy fractional-order PID controllers —	322
9.5.1	Fuzzy rules of the controller parameters —	322
9.5.2	Design and implementation with Simulink —	323
10	Frequency domain controller design for multivariable fractional-order systems —	329
10.1	Pseudodiagonalisation of multivariable systems —	329
10.1.1	Pseudodiagonalisation and implementations —	330
10.1.2	Individual channel design of the controllers —	333
10.1.3	Robustness analysis of controller design through examples —	337
10.2	Parameter optimisation design for multivariable fractional-order systems —	340
10.2.1	Parameter optimisation design of integer-order controller —	340
10.2.2	Design procedures of parameter optimisation controllers —	343
10.2.3	Investigations on the robustness of the controllers —	347
10.2.4	Controller design for plants with time delays —	349
A	Inverse Laplace transforms involving fractional and irrational operations —	353
A.1	Special functions for Laplace transform —	353
A.2	Laplace Transform tables —	353
B	FOTF Toolbox functions and models —	357
B.1	Computational MATLAB functions —	357

B.2 Object-oriented program design — 359

B.3 Simulink models — 361

B.4 Functions and models for the examples — 361

**C Benchmark problems for the assessment of fractional-order differential
equation algorithms — 363**

Bibliography — 365

Index — 369
