Part I Overview

2	The Future of Experimental Research	17
	Thomas Bartz-Beielstein and Mike Preuss	
2.1	Introduction	17
2.2	Experimental Goals in Computer Science	19
2.2.1	Improving the Performance	20
2.2.2	Understanding	21
2.3	Problems	21
2.3.1	Problems Related to the Experimental Setup	22
2.3.2	Problems Related to the Significance of Experimental Results	22
2.3.3	Problems Related to High-Level Theory	25
2.4	The New Experimentalism	27
2.5	Experimental Models	28
2.5.1	The Role of Models in Science	28
2.5.2	Representational Models	29
2.5.3	A Framework of Models	30
2.5.4	Mayo's Learning Model	32

2.5.5	Sequential Parameter Optimization	34
2.5.6	The Large n Problem Revisited	38
2.6	Pitfalls of Experimentation with Randomized Algorithms	38
2.6.1	Floor and Ceiling Effects	39
2.6.2	Confounded Effects	40
2.6.3	Fairness in Parameter Settings	40
2.6.4	Failure Reasons and Prevention	41
2.7	Tools: Measures and Reports	42
2.7.1	Measures	42
2.7.2	Reporting Experiments	44
2.8	Methodology, Open Issues, and Development	45
2.9	Summary	46
	References	47
3	Design and Analysis of Computational Experiments: Overview	51
	Jack P.C. Kleijnen	
3.1	Introduction	51
3.2	Classic Designs and Metamodels	54
3.3	Screening: Sequential Bifurcation	57
3.4	Kriging	58
3.4.1	The Kriging Predictor Variance	60
3.4.2	Designs for Kriging	61
3.5	Optimization	63
3.5.1	Response Surface Methodology (RSM)	63
3.5.2	Kriging and Mathematical Programming	65
3.5.3	Taguchian Robust Optimization	67
3.6	Conclusions	69
	References	70
4	The Generation of Experimental Data for Computational Testing in Optimization	73
	Nicholas G. Hall and Marc E. Posner	
4.1	Introduction	73
4.2	A Protocol	76
4.2.1	Generation Principles and Properties	78
4.2.2	Features of the Model	81
4.2.3	Validating the Data	81
4.3	Applications to Optimization	83
4.3.1	Generalized Assignment and Knapsack	84
4.3.2	Supply Chains	85
4.3.3	Scheduling	87
4.3.4	Graphs and Networks	88
4.3.5	Routing	89
4.3.6	Data Mining	90
4.3.7	Stochastic Programming	91
4.3.8	Intractable Problems	92

4.4	Concluding Remarks	94
	References	94
5	The Attainment-Function Approach to Stochastic Multiobjective Optimizer Assessment and Comparison	103
	Viviane Grunert da Fonseca and Carlos M. Fonseca	
5.1	Introduction	103
5.2	Statistics and the Attainment-Function Approach	105
5.2.1	Stochastic Optimizers as Statistical Estimators	105
5.2.2	Optimizer Performance as Statistical Estimator Performance	106
5.2.3	Performance Assessment via Estimation and Hypothesis Testing	108
5.3	Multiobjective Optimizer Outcomes	109
5.3.1	Random Nondominated Point Sets	109
5.3.2	Alternative View: The Attained Set	109
5.4	Multiobjective Optimizer Performance	110
5.4.1	Distribution of a General Random Closed Set: The Capacity Functional	111
5.4.2	Distribution of a Random Nondominated Point Set: The k -th-Order Attainment Function	111
5.5	Partial Aspects of Multiobjective Optimizer Performance	113
5.5.1	Distribution Location: The First-Order Attainment Function	113
5.5.2	Distribution Spread: The Variance Function	116
5.5.3	Inter-Point Dependence Structures: Second and Higher-Order Attainment Functions	117
5.6	Multiobjective Optimizer Performance Assessment: Estimation ...	119
5.7	Multiobjective Optimizer Performance Comparison: Hypothesis Testing	121
5.7.1	Two-Sided Test Problem	122
5.7.2	Permutation Test Procedure	123
5.7.3	Multistage Testing	124
5.7.4	One-Sided Tests	126
5.8	Discussion and Future Perspectives	127
	References	128
6	Algorithm Engineering: Concepts and Practice	131
	Markus Chimani and Karsten Klein	
6.1	Why Algorithm Engineering?	131
6.1.1	Early Days and the Pen-and-Paper Era	132
6.1.2	Errors	133
6.2	The Algorithm Engineering Cycle	135
6.3	Current Topics and Issues	137
6.3.1	Properties of and Structures in the Input	138
6.3.2	Large Datasets	139

6.3.3	Memory Efficiency	140
6.3.4	Distributed Systems and Parallelism	143
6.3.5	Approximations and Heuristic Algorithms	144
6.3.6	Succinct Data Structures	145
6.3.7	Time-Critical Settings	146
6.3.8	Robustness	146
6.4	Success Stories	147
6.4.1	Shortest Path Computation	147
6.4.2	Full-Text Indexes	150
6.5	Summary and Outlook	153
	References	154

Part II Characterizing Algorithm Performance

7	Algorithm Survival Analysis	161
	Matteo Gagliolo and Catherine Legrand	
7.1	Introduction	161
7.2	Modeling Runtime Distributions	162
7.2.1	Basic Quantities and Concepts	163
7.2.2	Censoring	165
7.2.3	Estimation in Survival Analysis	166
7.2.4	Competing Risks	169
7.3	Model-Based Algorithm Selection	171
7.3.1	RTD of an Algorithm Portfolio	173
7.3.2	Model-Based Time Allocators	174
7.3.3	Algorithms as Competing Risks	175
7.4	Experiments	175
7.5	Related Work	179
7.6	Summary and Outlook	180
	References	181
8	On Applications of Extreme Value Theory in Optimization	185
	Jürg Hüsler	
8.1	Introduction	185
8.2	Extreme Value Theory	186
8.2.1	Extreme Value Theory for Minima	186
8.2.2	Peaks Over Threshold Method (POT) for Minima	189
8.2.3	Assessment of an Optimizer	191
8.3	Experiments Using Random Search	192
8.3.1	Samples with Simulations Near the Optimum	193
8.3.2	Samples with Simulations Away from the Optimum	194
8.4	Analytical Results	195
8.5	Experiments Using Evolution Strategies	199
8.6	Summary	205
