1	Introduction	1
2	Fundamentals of Communication Systems and Information Theory	5
2.1	Information-Theoretic Elements	7
2.1.1	Notation	7
2.1.2	Metrics and Properties	8
2.2	Coded Modulation	12
2.2.1	Digital Communication Systems	12
2.2.2	Coded Modulation Techniques	14
2.2.3	Modulation Formats	15
2.2.4	Forward Error Correction	16
2.3	Achievable Information Rates	19
2.3.1	Symbol-Wise Decoding with Soft Information	19
2.3.2	Mismatched Decoding	20
2.3.3	Bit-Metric Decoding with Soft Information	26
2.3.4	Hard-Decision Decoding	31
2.3.5	AIR Evaluation via Monte Carlo Simulations	32
2.4	Probabilistic Shaping	37
2.4.1	Fundamentals and Maxwell-Boltzmann Distributions	38
2.4.2	Probabilistic Amplitude Shaping (PAS) Scheme	40
2.4.3	Fixed-Input Shaping for the AWGN Channel	44
2.5	Summary	51
3	Principles of Fiber-Optic Communication Systems	53
3.1	Propagation of Light in Single-Mode Fibers	55
3.1.1	Propagation Equations	55
3.1.2	Signal Distortions	57
3.1.3	Analytical Solutions of the NLSE	62
3.1.4	Numerical Solution: Split-Step Fourier Method	64
3.2	Gaussian Noise Approximations	66
3.2.1	Classic GN Model	69
3.2.2	SPM-XPM Model	71

3.3	Components of Optical Communication Systems	75
3.3.1	Transmitter	75
3.3.2	Fiber	79
3.3.3	Optical Amplifiers	80
3.3.4	Coherent Optical Front-End	85
3.3.5	Digital Signal Processing	88
3.4	Summary	95
4	Achievable Information Rates for Optical Fiber Systems	97
4.1	Preliminaries	97
4.2	Application as Figure of Merit	99
4.2.1	AIRs for QAM with HD and SD Decoders	100
4.2.2	Comparison of FEC Decoding to Asymptotic Limits	102
4.2.3	Spectral Efficiency for Varying WDM Spacings	104
4.2.4	Comparison of EDC, SC DBP, and MC DBP	106
4.2.5	Conclusion	109
4.3	Impact of Multidimensional Demapping	110
4.3.1	Auxiliary Channel Models	110
4.3.2	Experimental Results	112
4.3.3	Blind Estimation of Channel Statistics	120
4.3.4	Decoding and Information Rate Analysis	122
4.4	Summary	126
5	Probabilistic Shaping for Fiber Optics	129
5.1	Back-to-back Experiments	131
5.1.1	Experimental Setup	131
5.2	Nonlinear Fiber Channel	134
5.2.1	Maxwell-Boltzmann Input Distributions	134
5.2.2	Shaping Optimization for Long-Haul Fiber Links	141
5.2.3	Sensitivity to Nonlinear Effects	142
5.3	Summary	147
6	Memory from Dispersion and Fiber Nonlinearities	149
6.1	Preliminaries	150
6.1.1	Block-Wise Channel Model	150
6.1.2	Phase Noise (PN) Receiver	151
6.1.3	Auto-Correlation Function	152

6.1.4	Characterization of NLPN	154
6.2	Exploiting Correlations by Post-Processing	156
6.2.1	Blind Trellis-Based Processing	156
6.2.2	Simulation Setup	157
6.2.3	Results	158
6.3	Measurement Limitations due to CPE	163
6.3.1	Simulation and Experimental Setup	163
6.3.2	Simulation Results	164
6.3.3	Experimental Results	168
6.4	Self-Homodyne Detection to Measure Nonlinear Correlations	169
6.4.1	Experimental Setup	169
6.4.2	Results	170
6.5	Summary	172
7	Conclusions	177
A	Appendices	181
A.1	Derivation of the Monte Carlo Estimate of R_{BMD}	181
A.2	Construction of a Binary Reflected Gray Code	184
A.3	Optimization Algorithms for Probabilistic Shaping	186
A.3.1	Bisection Algorithm	186
A.3.2	Golden Section Search	189
A.4	Constant Composition Distribution Matcher	192
A.5	Derivation of the GN Model	196
A.5.1	Preliminaries	196
A.5.2	Classic GN Model	200
A.5.3	Enhanced GN Model	216
B	Notation, Symbols, and Acronyms	219
B.1	Mathematical Notation	219
B.2	List of Symbols	221
B.3	List of Acronyms	223
