

# Contents

<b>1</b>	<b>Introduction — 1</b>
1.1	Observational Background — 2
1.2	Theoretical Background — 5
1.3	Organization of the Material — 12
<b>2</b>	<b>Dynamical Drivers of Galaxy Evolution — 14</b>
2.1	Motivation and Outline for the Theoretical Approach — 14
2.2	Density Wave Crest as the Site of Gravitational Instability — 18
2.2.1	Local Stability Condition at the Spiral Arm and Interarm Region — 19
2.2.2	Length Scale of Spiral Instability at the Solar Neighborhood — 22
2.3	Potential-Density Phase Shifts for Density Wave Modes — 24
2.3.1	Definition of the Potential-Density Phase Shift — 24
2.3.2	A Phase Shift Given by the Poisson Integral — 27
2.3.3	Phase Shifts in the Eulerian Equations of Motion and in the Linear Periodic Orbit Solution — 29
2.3.4	Phase Shift in the Linear and Nonlinear Regimes of the Eulerian Solutions — 32
2.4	Linear Regime and Quasi-Steady State of the Wave Modes — 34
2.4.1	The Process of Reaching the Quasi-Steady State — 35
2.4.2	Reconciliation of the Two-Wave Superposition and the Unstable-Mode Points of View — 40
2.5	Torque Coupling and Angular Momentum Transport — 46
2.5.1	Torque Couplings due to Density Waves — 46
2.5.2	The Relation Between the Torque Couplings and the Rate of Angular Momentum Change in the Disk — 48
2.5.3	The Relation Between the Volume-Torque Integral $\overline{\mathcal{T}}$ and the Torque-Coupling Integrals $C_g$ and $C_a$ — 51
2.5.4	A Closure Relation for the Quasi-Steady State — 53
2.6	Rates of Secular Evolution — 56
2.6.1	Secular Change in the Mean Stellar Orbital Radius — 57
2.6.2	Secular Heating of the Galactic Disk — 59
2.6.3	Secular Mass Flow Rate Determination — 60
2.6.4	Secular Change of Disk Surface Density — 62
2.6.5	Viscous Accretion Disk Analogy — 65
2.7	Relation to “Broadening of Resonances” — 67
2.8	In a Nutshell — 69

<b>3</b>	<b><i>N</i>-Body Simulations of Galaxy Evolution — 70</b>
3.1	Overview of <i>N</i> -Body Simulations of Disk Galaxies — 70
3.2	Simulation Codes and Basic State Specifications — 71
3.2.1	Choice of Basic State Parameters — 72
3.2.2	Choice of Simulation Parameters (First-Generation Tests) — 74
3.3	Signature of Collisionless Shock in <i>N</i> -Body Spirals — 77
3.4	Modal Nature of a Spontaneously Formed Pattern — 85
3.5	Qualitative Signature of Secular Mass Redistribution — 90
3.6	Longevity of the Spiral Modes — 93
3.6.1	Faithfulness of the <i>N</i> -Body Simulations — 93
3.6.2	Three Test Runs Using Different Numbers of Particles — 95
3.6.3	Lifetime of a Spiral Pattern Inferred from <i>N</i> -Body Simulations — 98
3.7	Role of Gas — 99
3.8	Implication on Orbits as “Building Blocks” — 103
3.9	Second-Generation Tests — 109
3.9.1	The Critical Roles of the Softening Parameter — 110
3.9.2	The Impact of Softening on <i>N</i> -Body Simulated Mass Flow Rates — 111
3.9.3	Four Runs with Differing Softening Parameters — 114
3.9.4	Grid Noise Associated with the Use of Small Particle Softening Parameter — 137
3.9.5	Accuracy and Implications of the Secular Radial Mass Flow Rates Obtained in <i>N</i> -Body Simulations — 143
<b>4</b>	<b>Astrophysical Implications of the Dynamical Theory — 146</b>
4.1	Motivations and General Outline — 146
4.2	PDPS Method for CR Determination — 149
4.2.1	Dynamical Basis and Practical Considerations for the PDPS Method — 149
4.2.2	First Application of the Method: NGC 1530 — 153
4.2.3	Phase Shift in a Pure Spiral Galaxy: NGC 5247 — 157
4.2.4	Multiple Nested Resonances: NGC 4321 — 158
4.2.5	Phase Shift in an Interacting Galaxy: M51 — 161
4.2.6	Regarding the So-Called “Super-Fast Bars” — 162
4.2.7	Physical Basis Underlying the Validity and Accuracy of the Phase Shift Method — 164
4.2.8	Implications for the Kinematics and Dynamics of Nearby Galaxies — 167

4.3	Secular Mass Migration and Bulge Building —	169
4.3.1	Formation and Evolution of Galactic Bulges —	170
4.3.2	Secular Mass Flow Rate Determination Using NIR and MIR Images —	172
4.3.3	Relative Contributions from Gravitational and Advective Torques —	179
4.3.4	Relative Contributions of Stellar and Gaseous Mass Flows —	181
4.4	Secular Heating and the Age–Velocity–Dispersion Relation —	187
4.4.1	The Age–Velocity Dispersion Relation of the Solar Neighborhood Stars —	188
4.4.2	The Cause of Isotropic Velocity Diffusion in Three Dimensions and the Preservation of the Gaussian Velocity Distribution through Time —	191
4.4.3	The Origin of Radial Variation of the Stellar Velocity Dispersion with Galactocentric Distance —	191
4.5	Secular Heating and the Size–Line-Width Relation —	193
4.5.1	History and Motivation —	193
4.5.2	Energy Injection into the Star-Gas Two-Fluid through the Spiral Collisionless Shock —	195
4.5.3	The Rate of Energy Injection and Rate of Energy Cascade —	196
4.5.4	Application: The Carina Molecular Cloud Complex —	197
4.6	Other Characteristics of the Milky Way Galaxy and External Galaxies —	202
4.6.1	Mass Distribution of the Different Galactic Components —	203
4.6.2	Stellar Population and Kinematics in the Thin and Thick Disks —	204
4.7	Universal Rotation Curve —	205
4.8	Formation and Maintenance of Galaxy Scaling Relations —	209
4.8.1	General Considerations —	209
4.8.2	Origin and Evolution of the Scaling Relations —	210
4.9	Butcher–Oemler Effect and Evolution of Cluster Galaxies —	214
4.9.1	Observations and Candidate Mechanisms of the Morphological BO Effect —	214
4.9.2	An Infrared Diagnostic Approach for the Star-Formation States of Cluster Galaxies —	217
4.9.3	Application of the Infrared Diagnostic Approach —	224
4.9.4	Other Cluster Observations in Support of Secular Evolution —	228

	4.9.5 Further Comments on the Different Proposed Mechanisms for Cluster Galaxy Evolution —	229
4.10	Secular Evolution and the Origin of Color–Magnitude Relation —	233
4.11	An Example of Secular Evolution in Interacting Galaxies —	234
	4.11.1 Background —	235
	4.11.2 Previous Observations and Simulations of the Leo Triplet —	237
	4.11.3 CO 1-0 and HI Aperture Synthesis Observations of NGC 3627 —	237
	4.11.4 Analysis and Discussion —	239
4.12	Black Hole Mass and Bulge Mass Correlation —	243
<b>5</b>	<b>Putting It All Together —</b>	<b>246</b>
5.1	Reexamine the Foundations —	246
	5.1.1 On the Modal and Quasi-Steady State Hypotheses of Density Waves in Physical and Simulated Disk Galaxies —	246
	5.1.2 Role of Basic State Specification —	260
5.2	Broader Implications —	266
	5.2.1 Self-Organization in Nonequilibrium Systems and the Formation of Singularity Hierarchy —	266
	5.2.2 Implications on the Cosmological Evolution of Galaxies —	269
<b>6</b>	<b>Concluding Remarks —</b>	<b>284</b>
<b>7</b>	<b>Appendix: Relation to Kinetics and Fluid Mechanics —</b>	<b>287</b>
7.1	Foundation of Kinetic Theory: The Boltzmann Equation —	287
	7.1.1 Outline of the Derivation of the Boltzmann Equation Through the BBGKY Hierarchy —	287
	7.1.2 Growth of Instability and the Arrow of Time —	292
7.2	From Kinetic Theory to Fluid Mechanics —	294
7.3	Nonequilibrium Phase Transition and Galaxy Evolution —	296
7.4	The Proper Choice of Analytical Hierarchies —	297
