

# Contents

**Subvolume I/21B1: Chapters 1 - 4**

**Subvolume I/21B2: Chapters 5 - 8**

The following Chapters are contained in the present Subvolume I/21B1

|          |                                                                                              |            |
|----------|----------------------------------------------------------------------------------------------|------------|
| <b>1</b> | <b>Introduction</b> (C.W. FABJAN, H. SCHOPPER) . . . . .                                     | <b>1-1</b> |
| <b>2</b> | <b>The Interaction of Radiation with Matter</b> (H. BICHSEL) . . . . .                       | <b>2-1</b> |
| 2.1      | Introduction . . . . .                                                                       | 2-1        |
| 2.1.1    | General concepts . . . . .                                                                   | 2-1        |
| 2.1.2    | Types of collisions . . . . .                                                                | 2-2        |
| 2.1.3    | Observable effects of radiations . . . . .                                                   | 2-2        |
| 2.1.4    | Stopping power $dE/dx$ . . . . .                                                             | 2-2        |
| 2.2      | Historical background . . . . .                                                              | 2-3        |
| 2.3      | Description of the most frequent interactions of single fast charged particles . . . . .     | 2-3        |
| 2.3.1    | Narrow beams and straggling of heavy charged particles . . . . .                             | 2-4        |
| 2.3.2    | Narrow beams of low energy electrons . . . . .                                               | 2-4        |
| 2.3.3    | Relation between track length and energy loss . . . . .                                      | 2-4        |
| 2.3.4    | Nuclear interactions . . . . .                                                               | 2-5        |
| 2.4      | Photon interactions . . . . .                                                                | 2-7        |
| 2.4.1    | Gases . . . . .                                                                              | 2-8        |
| 2.4.2    | Solids . . . . .                                                                             | 2-8        |
| 2.4.3    | Data for DOS . . . . .                                                                       | 2-8        |
| 2.5      | Interaction of heavy charged particles with matter . . . . .                                 | 2-9        |
| 2.5.1    | Inelastic scattering, excitation and ionization of atoms or condensed state matter . . . . . | 2-10       |
| 2.5.1.1  | Bethe-Fano (B-F) method . . . . .                                                            | 2-10       |
| 2.5.1.2  | Relativistic extension of B-F method . . . . .                                               | 2-11       |
| 2.5.1.3  | Fermi-virtual-photon (FVP) cross section . . . . .                                           | 2-13       |
| 2.5.2    | Integral quantities: moments . . . . .                                                       | 2-15       |
| 2.5.2.1  | Comparison of moments: Si, Ne, P10 . . . . .                                                 | 2-18       |
| 2.6      | Electron collisions and bremsstrahlung . . . . .                                             | 2-18       |
| 2.6.1    | Electronic collisions . . . . .                                                              | 2-18       |
| 2.6.2    | Bremsstrahlung BMS . . . . .                                                                 | 2-21       |
| 2.7      | Energy losses along tracks: multiple collisions and spectra . . . . .                        | 2-23       |
| 2.7.1    | Monte Carlo method . . . . .                                                                 | 2-23       |
| 2.7.2    | Analytic methods . . . . .                                                                   | 2-25       |
| 2.7.2.1  | Convolutions . . . . .                                                                       | 2-25       |
| 2.7.2.2  | Laplace transforms . . . . .                                                                 | 2-26       |
| 2.7.3    | Analytic methods for thick absorbers . . . . .                                               | 2-26       |
| 2.8      | Evaluations and properties of straggling functions . . . . .                                 | 2-26       |
| 2.8.1    | Very thin absorbers . . . . .                                                                | 2-26       |
| 2.8.2    | Thin absorbers . . . . .                                                                     | 2-27       |
| 2.8.3    | Thick absorbers . . . . .                                                                    | 2-30       |
| 2.8.4    | Comparisons of spectra . . . . .                                                             | 2-30       |
| 2.9      | Energy deposition . . . . .                                                                  | 2-30       |
| 2.9.1    | Ionization . . . . .                                                                         | 2-31       |
| 2.9.2    | Delta rays . . . . .                                                                         | 2-31       |
| 2.9.3    | Auger electrons and photons . . . . .                                                        | 2-32       |

|              |                                                                                                             |             |
|--------------|-------------------------------------------------------------------------------------------------------------|-------------|
| 2.9.4        | Cherenkov radiation . . . . .                                                                               | 2-33        |
| 2.9.5        | Transition radiation . . . . .                                                                              | 2-33        |
| 2.9.6        | Ion beams . . . . .                                                                                         | 2-33        |
| 2.10         | Particle ID . . . . .                                                                                       | 2-34        |
| 2.11         | Discussion and recommendations . . . . .                                                                    | 2-34        |
| 2.12         | Appendix . . . . .                                                                                          | 2-34        |
|              | References for 2 . . . . .                                                                                  | 2-38        |
| <b>3</b>     | <b>Particle Detectors and Detector Systems . . . . .</b>                                                    | <b>3-1</b>  |
| <b>3.1</b>   | <b>Charged Particle Detectors . . . . .</b>                                                                 | <b>3-1</b>  |
| <b>3.1.1</b> | <b>Scintillation Detectors for Charged Particles and Photons (P. LECOQ) . . . . .</b>                       | <b>3-1</b>  |
| 3.1.1.1      | Basic detector principles and scintillator requirements . . . . .                                           | 3-1         |
| 3.1.1.1.1    | Interaction of ionizing radiation with scintillator material . . . . .                                      | 3-1         |
| 3.1.1.1.2    | Important scintillator properties . . . . .                                                                 | 3-3         |
| 3.1.1.1.2.1  | Physico-chemical properties . . . . .                                                                       | 3-3         |
| 3.1.1.1.2.2  | Optical properties . . . . .                                                                                | 3-4         |
| 3.1.1.1.2.3  | Radiation hardness . . . . .                                                                                | 3-6         |
| 3.1.1.1.3    | Scintillator requirements for various applications . . . . .                                                | 3-6         |
| 3.1.1.1.3.1  | High-and medium-energy physics particle detectors . . . . .                                                 | 3-7         |
| 3.1.1.1.3.2  | Astrophysics and space . . . . .                                                                            | 3-8         |
| 3.1.1.1.3.3  | Spectrometry of low energy $\gamma$ -quanta . . . . .                                                       | 3-8         |
| 3.1.1.1.3.4  | Medical imaging . . . . .                                                                                   | 3-9         |
| 3.1.1.1.3.5  | Safety Systems and Homeland Security . . . . .                                                              | 3-10        |
| 3.1.1.1.4    | Organic material, glass and condensed gases . . . . .                                                       | 3-11        |
| 3.1.1.2      | Scintillation and quenching mechanisms in inorganic scintillators . . . . .                                 | 3-11        |
| 3.1.1.2.1    | The 5 steps in scintillation process . . . . .                                                              | 3-11        |
| 3.1.1.2.2    | Scintillation efficiency . . . . .                                                                          | 3-13        |
| 3.1.1.2.3    | Response linearity and energy resolution . . . . .                                                          | 3-15        |
| 3.1.1.3      | Role of defects on scintillation properties and on radiation damage in<br>inorganic scintillators . . . . . | 3-18        |
| 3.1.1.3.1    | Structural defects in a crystal . . . . .                                                                   | 3-18        |
| 3.1.1.3.1.1  | Point size defects . . . . .                                                                                | 3-19        |
| 3.1.1.3.1.2  | Impurities . . . . .                                                                                        | 3-19        |
| 3.1.1.3.2    | Impact of defects on optical properties . . . . .                                                           | 3-19        |
| 3.1.1.3.2.1  | Charge carrier traps . . . . .                                                                              | 3-20        |
| 3.1.1.3.2.2  | Defect associated absorption bands . . . . .                                                                | 3-20        |
| 3.1.1.3.3    | Radiation damage . . . . .                                                                                  | 3-21        |
| 3.1.1.4      | Crystal engineering. Impact of new technologies . . . . .                                                   | 3-24        |
| 3.1.1.5      | Table of commonly used scintillators . . . . .                                                              | 3-26        |
|              | References for 3.1.1 . . . . .                                                                              | 3-26        |
