Nomenclature	xi
Abstract	xv
Kurzfassung	xvii
1 Introduction	1
1.1 The Concept of Personal Aerial Vehicles	1
1.2 Personal Aerial Vehicle's Response Types and Handling Qualities	3
1.3 Augmented Helicopters as Personal Aerial Vehicles	4
1.4 Model-Following Control Architecture	5
1.5 Actuators Analysis	7
1.6 Research Motivation and Objectives	8
1.6.1 Design of a Flight Control System to Transform Helicopters into Personal Aerial Vehicles	9
1.6.2 Definition of a Control Tuning Methodology for Multi-Objective Problems	10
1.6.3 Extension of Existing Methodologies to Study Absolute Stability of Systems with Input Saturation	10
1.7 Outline of the Thesis	10
1.8 Thesis Contributions and Limitations	12
1.9 List of Publications	14
2 Physics-Based Nonlinear Helicopter Model	17
2.1 Motivation	17
2.2 Implementation of the Nonlinear Helicopter Model	19
2.2.1 Helicopter Model Components	21
2.3 Validation of the Helicopter Model	27
2.3.1 Time Domain Analysis	27
2.3.2 Frequency Domain Analysis	31
2.4 State-Space Model	34
2.5 Conclusions	35

3	Model-Following Control with Linear Quadratic Regulator	39
3.1	Motivation	39
3.2	Response Types and Handling Qualities for Personal Aerial Vehicles	41
3.3	Model-Following Control Augmentation System	43
3.3.1	Feedback Control for the Inner-Loop	45
3.3.2	Advantages of the Servomechanism Linear Quadratic Regulator	47
3.3.3	Feedforward Control	49
3.3.4	Model-Following Total Control Input	50
3.3.5	Translational Rate Command Control Loop	51
3.4	Analysis and Validation of the Augmented Helicopter Responses	52
3.4.1	Roll and Pitch Attitude	52
3.4.2	Longitudinal and Lateral Velocity	53
3.4.3	Vertical Velocity	54
3.4.4	Yaw Rate	55
3.5	Simulations with the Nonlinear Helicopter Model	56
3.6	Conclusions	58
4	Control Design Requirements for Personal Aerial Vehicles	59
4.1	Motivation	59
4.2	Control Requirements for Rotorcraft	61
4.3	Summary of the Control Augmentation Strategy	62
4.4	Control Designs	63
4.5	Experimental Design and Metrics Definition	65
4.5.1	Apparatus	65
4.5.2	Experimental Conditions	65
4.5.3	Description of the Maneuver	67
4.5.4	Description of the Experiment	68
4.5.5	Evaluation Metrics	70
4.6	Experimental Results	72
4.6.1	Objective Evaluations	72
4.6.2	Subjective Evaluations	76
4.7	Discussion	78
4.8	Conclusions	79
5	Tuning Methodology for Multi-Objective Problems	81
5.1	Motivation	81

5.2	Control Architecture Overview	83
5.3	Control Gains Tuning Methodology	85
5.3.1	Four-Step Routine	85
5.3.2	Tuning of the Control Parameters	86
5.3.3	How to Apply the Tuning Methodology	86
5.4	Optimized Controller	90
5.5	Pilot-in-the-Loop Simulations	94
5.6	Conclusions	97
6	Partial Authority Stability Augmentation System with Input Saturation	99
6.1	Motivation	99
6.2	Ultralight Helicopter Dynamics	101
6.3	Full Authority Stability Augmentation System	101
6.3.1	Control Tuning	103
6.4	Stability Analysis Using the Circle Criterion	104
6.4.1	Absolute Stability with a Finite Domain for Autonomous Systems	106
6.4.2	Extension of the Circle Criterion for Non-Autonomous Systems	108
6.5	Partial Authority Stability Augmentation System	110
6.6	Discussion	113
6.7	Conclusions	115
7	Conclusions and Recommendations	117
7.1	Physics-Based Nonlinear Helicopter Model	118
7.1.1	Overview	118
7.1.2	Conclusions	119
7.1.3	Main Finding	119
7.2	Model-Following Control with Linear Quadratic Regulator	119
7.2.1	Overview	119
7.2.2	Conclusions	120
7.2.3	Main Finding	120
7.3	Control Design Requirements for Personal Aerial Vehicles	120
7.3.1	Overview	120
7.3.2	Conclusions	121
7.3.3	Main Finding	121

Contents

7.4	Tuning Methodology for Multi-Objective Problems	121
7.4.1	Overview	121
7.4.2	Conclusions	122
7.4.3	Main Finding	122
7.5	Partial Authority Stability Augmentation System with Input Saturation	122
7.5.1	Overview	122
7.5.2	Conclusions	123
7.5.3	Main Finding	123
7.6	Summary of the Thesis Contributions	123
7.7	Recommendations	124
A	Full and Low-Order Helicopter Dynamics	127
A.1	Full Helicopter Dynamics	127
A.2	Low-Order Helicopter Dynamics	128
B	Control Design Requirements	129
