Preface — V

1	Introduction — 1
1.1	Perturbed integrable problems — 2
1.2	Artificial satellite theory — 5
1.2.1	Significance of Lyapunov instability — 7
1.2.2	Geopotential long-period effects in closed form — 8
1.2.3	Tesseral effects — 10
1.2.4	Lunisolar perturbations — 12
1.2.5	Non-conservative perturbations — 14
1.2.6	Action-angle and non-singular variables — 16
1.3	Non-Earth orbits and perturbed non-Keplerian orbits — 18
1.3.1	The restricted three-body problem — 18
1.3.2	Hill problem simplifications — 19
1.3.3	Motion about planetary satellites — 21
1.3.4	Libration points orbits — 22
1.3.5	Coorbital motion with low eccentricity — 24

Part I: Hamiltonian perturbations by Lie transforms

2	The method of Lie transforms — 29
2.1	Lie transformation of a function — 29
2.1.1	The fundamental recursion — 31
2.1.2	Deprit's triangle — 33
2.1.3	The direct transformation — 34
2.1.4	Composition of Lie transformations — 35
2.1.5	The inverse transformation — 36
2.2	Deprit's perturbations approach — 37
2.2.1	Hamiltonian simplification by Lie transforms — 37
2.2.2	Example: Small oscillations of the simple pendulum — 39
2.2.3	The homological equation — 42
3	Application to integrable problems — 45
3.1	The simple gravity pendulum — 46
3.1.1	Hamiltonian reduction — 46
3.1.2	Rotation regime. Solution in action-angle variables — 48
3.1.3	Expanded solution by Lie transforms — 50
3.2	The free rigid body — 52
3.2.1	Rotation in the body frame — 53

- 3.2.2 Attitude in the space frame — 55
- 3.2.3 The invariable plane — 56
- 3.2.4 Hamiltonian formulation — 58
- 3.2.5 Closed-form solution by complete reduction — 59
- 3.2.6 The case of low triaxiality — 65
- 3.2.7 Short-axis-mode rotation — 67

Part II: Perturbed elliptic motion: Artificial satellite theory

- 4 The Kepler problem — 77**
 - 4.1 The orbital frame — 77
 - 4.2 Kepler Hamiltonian — 78
 - 4.3 Hamilton–Jacobi reduction — 80
 - 4.4 Solution in Delaunay variables — 83
 - 4.5 Useful relations for perturbed Keplerian motion — 86
 - 4.5.1 The apsidal frame. Fundamental vectors — 86
 - 4.5.2 Variation equations in vectorial elements — 87
 - 4.5.3 Differential relations and closed-form integration — 88
 - 4.5.4 Principal relations of the ellipse — 90
- 5 The main problem of the artificial satellite — 92**
 - 5.1 Geopotential Hamiltonian — 92
 - 5.2 Particular solutions — 94
 - 5.3 Secular effects — 95
 - 5.3.1 Picard iterations — 97
 - 5.3.2 Inclination resonances — 99
 - 5.4 Intermediaries — 100
 - 5.4.1 Common intermediaries — 101
 - 5.4.2 Natural intermediaries — 102
 - 5.4.3 Torsions for quasi-Keplerian systems — 105
 - 5.5 Discretization of the flow — 106
 - 5.6 The critical inclination — 110
 - 5.6.1 First order — 110
 - 5.6.2 Second order — 111
 - 5.6.3 The reduced phase space. Frozen orbits — 113
 - 5.6.4 Reduced dynamics on the sphere — 116
 - 5.7 Semi-analytical integration — 119
 - 5.7.1 Short-period corrections in Delaunay variables — 120
 - 5.7.2 Short-period corrections in non-singular variables — 121
- 6 Zonal perturbations — 124**

6.1	Zonal problem in mean elements — 124
6.1.1	Averaged flow — 127
6.1.2	Inclination–eccentricity diagrams of frozen orbits — 129
6.1.3	Local dynamics: eccentricity-vector diagrams — 131
6.2	Hamiltonian simplification — 133
6.2.1	Deprit's elimination of the parallax — 134
6.2.2	Delaunay normalization — 137
6.2.3	Short-period corrections — 139
6.3	Brouwer's solution by complete reduction — 141
6.3.1	Secular terms — 141
6.3.2	Long-period corrections — 143
6.4	Reverse normalization. Long periods removed first — 144
6.4.1	Normalization of the total angular momentum — 145
6.4.2	Normalization of the semimajor axis — 149
6.4.3	Alfriend and Coffey's elimination of the perigee — 151
6.5	Higher orders of the perturbation solution. A test case — 153
6.5.1	Preliminary simplification. Elimination of the parallax — 154
6.5.2	Partial normalization. Long-period elimination — 156
6.5.3	Complete Hamiltonian reduction. Short-period elimination — 159
6.5.4	Secular frequencies — 162
6.5.5	Sample application. The PRISMA orbit — 165
6.6	Initialization issues. Breakwell and Vagners' approach — 173
6.7	Centered elements — 174

7 Tesseral perturbations — 176

7.1	Tesseral potential in orbital elements — 176
7.2	Low-Earth orbits. Garfinkel's perturbation approach — 177
7.2.1	Elimination of the parallax of tesseral terms — 178
7.2.2	Delaunay normalization. m -daily terms — 180
7.2.3	Elimination of the node. Long-term Hamiltonian — 182
7.3	Exact integration to the second order of J_2 — 183
7.4	Relegation of tesseral effects — 186
7.4.1	Basic algorithm — 186
7.4.2	Tesseral relegation with low eccentricity — 187
7.4.3	Sample applications — 189
7.5	Tesseral resonances — 193
7.5.1	Resonant terms of the geopotential — 194
7.5.2	Short-period elimination — 196
7.5.3	The 2:1 resonance. GPS orbits — 199
7.5.4	The 5:3 resonance. Galileo disposal orbits — 201

8 Lunisolar perturbations — 203

8.1	The third-body potential — 203
8.1.1	Expansion of the potential for a close-Earth satellite — 204
8.1.2	The disturbing potential in the apsidal frame — 205
8.2	Long-term motion. The extended phase space — 206
8.2.1	Short-period elimination by Lie transforms — 207
8.2.2	Averaged flow in vectorial elements — 208
8.2.3	Sample application. The case of high Earth orbits — 211
8.3	Third-body's mean anomaly averaging — 213
8.3.1	Moon and Sun disturbing effects — 214
8.3.2	Additional simplifications. Long-term Hamiltonian — 217
8.4	Perturbations in the ecliptic frame — 219
8.4.1	The disturbing potential — 220
8.4.2	Removing short-period effects — 221
8.4.3	Removing monthly and annual effects — 224
8.4.4	Elimination of the Moon's longitude of the node — 226
8.5	Kudielka's balanced orbits — 227
8.5.1	The manifold of circular orbits — 229
8.5.2	The manifold of polar orbits orthogonal to the equinox — 232
8.5.3	Other equilibria — 234
9	Non-conservative effects — 235
9.1	Solar-radiation pressure — 235
9.1.1	The disturbing SRP "potential" — 236
9.1.2	Hamiltonian short-period reduction in the synodic frame — 236
9.1.3	Particular solutions — 238
9.1.4	General solution in vectorial elements — 239
9.1.5	Complete Hamiltonian reduction in action-angle variables — 241
9.1.6	Short-period reduction in the equatorial frame — 242
9.2	Atmospheric drag — 243
9.2.1	Atmospheric density — 243
9.2.2	Rotating atmosphere — 244
9.2.3	Gauss equations of variation — 245
9.2.4	Perturbation equations — 247

Part III: Relative motion and perturbed non-Keplerian motion

10	The Hill problem — 253
10.1	The circular restricted three-body problem — 253
10.1.1	Synodic frame. The Jacobi integral — 254
10.1.2	Hamiltonian formulation — 255
10.1.3	Surfaces and curves of zero velocity — 256

10.2	Hill's simplifying assumptions —	257
10.2.1	Equilibria. Hill's sphere —	260
10.2.2	Motion near the equilibrium points —	262
10.2.3	Basic families of periodic orbits —	263
11	Motion inside Hill's sphere —	265
11.1	Perturbed Keplerian motion —	265
11.1.1	Short-period elimination —	266
11.1.2	Elimination of the node in the rotating frame —	267
11.1.3	Third-body critical inclination. The Lidov–Kozai resonance —	268
11.2	Higher-order dynamics —	271
11.2.1	Degeneracy at the third order —	271
11.2.2	Fourth-order corrections —	274
11.2.3	Higher-order refinements —	276
11.3	The case of planetary satellites —	278
11.3.1	Elimination of the mean anomaly —	280
11.3.2	Elimination of the longitude of the node —	281
11.3.3	Reduced phase space in the parameters plane —	282
11.3.4	Third-order effects. The space of parameters —	287
11.4	Application. Computation of the science orbit —	288
11.4.1	Mean to osculating transformation —	291
11.4.2	Mapping orbits —	293
12	Motion about the libration points —	295
12.1	Perturbation solution —	295
12.1.1	The center manifold —	296
12.1.2	Homological equation in complex variables —	298
12.1.3	Detuning. The perturbed elliptic oscillator —	299
12.1.4	Hamiltonian normalization —	302
12.2	Reduced dynamics in the center manifold —	303
12.2.1	Visualization of the reduced flow —	304
12.2.2	Equilibria and bifurcations. Analytical computation —	304
12.2.3	Partner orbits of the equilibria in the center manifold —	306
12.3	Higher orders —	308
12.3.1	Lyapunov orbits —	310
12.3.2	Resonant orbits —	310
13	Quasi-satellite orbits —	313
13.1	Planar case. Epicyclic coordinates —	313
13.2	Elimination of short-period effects —	316
13.2.1	Lower orders —	317
13.2.2	Higher orders —	318

13.2.3	Additional Hamiltonian terms —	321
13.2.4	Long-period Hamiltonian —	322
13.3	The nature of the long-term solution —	322
13.4	Complete Hamiltonian reduction —	324
13.4.1	Extended harmonic transformation —	324
13.4.2	Secular Hamiltonian —	325
13.4.3	Long-period corrections —	327
13.4.4	Orbit design parameters —	329
13.4.5	Periodic orbits —	329
13.5	Examples —	331
13.5.1	Large amplitude libration —	331
13.5.2	1:1 resonance —	334
